## Pinus echinata / Vaccinium (pallidum, stamineum) - Kalmia latifolia Forest

COMMON NAME Shortleaf Pine / (Hillside Blueberry, Deerberry) - Mountain Laurel Forest

SYNONYM Appalachian Shortleaf Pine Forest

PHYSIOGNOMIC CLASS Forest (I)

PHYSIOGNOMIC SUBCLASS Evergreen forest (I.A)

PHYSIOGNOMIC GROUP Temperate or subpolar needle-leaved evergreen forest (I.A.8)

PHYSIOGNOMIC SUBGROUP Natural/Semi-natural (I.A.8.N)

FORMATION Rounded-crowned temperate or subpolar needle-leaved evergreen forest

(I.A.8.N.b)

ALLIANCE Pinus echinata Forest Alliance

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### **Globally**

This forest is known from the low elevation mountains of Georgia, Kentucky, North Carolina, South Carolina, Tennessee.

#### Great Smoky Mountains National Park

This association was not observed or sampled on the Mount Le Conte or Cades Cove quadrangles. However, forests dominated by *Pinus echinata* are thought to occur within the Park boundary.

#### ENVIRONMENTAL DESCRIPTION

#### **Globally**

These forests occur in the lower elevations (below 2400 feet) of the southern Appalachian Mountains on ridges and upper slopes, typically with south to west exposures.

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### **Globally**

This association occurs in the southern Blue Ridge of Georgia, North Carolina, South Carolina, and Tennessee, and may extend into Kentucky, and Virginia.

## Great Smoky Mountains National Park

This community was sampled on the Cades Cove and Mount Le Conte quadrangles and is likely in other areas of the Park. Samples on the Cades Cove quadrangle ranged in elevation from 1600 to 2100 feet, mostly in the northwest portion of the quadrangle. Samples of this community came from slopes above More Licker Branch; from slopes along Abrams Creek, northeast of Spruce Double; from slopes above Arbutus Branch; from a ravine south of Coon Butt; and from low slopes in the vicinity of Wildcat Branch. This community is uncommon on the Mount Le Conte quadrangle and was sampled from a single location in the northeastern portion of the quadrangle, on steep, southwest slopes above the Little Pigeon River (1400 feet). This may be the only location for this community on the Mount Le Conte quadrangle.

#### ENVIRONMENTAL DESCRIPTION

#### Globally

This community occurs on creek and river margins and on lower or protected slopes.

#### Great Smoky Mountains National Park

This community is found at low elevations on low, protected slopes, and flats along streams. Samples of this community had a mean elevation of 1800 feet, ranging from 1400 to 2100 feet. Samples had southwest, west, northwest, and northeast aspects.

## MOST ABUNDANT SPECIES

Short shrub (Leucothoe fontanesiana)

#### CHARACTERISTIC SPECIES

#### Globally

Pinus strobus, Rhododendron maximum, Leucothoe fontanesiana

#### Great Smoky Mountains National Park

Pinus strobus, Tsuga canadensis, Rhododendron maximum

#### VEGETATION DESCRIPTION

#### Globally

Forest vegetation dominated by *Pinus strobus*, sometimes codominating with *Tsuga canadensis*, occurring over a shrub stratum dominated by *Rhododendron maximum*. Other minor canopy species may include *Liriodendron tulipifera*, *Betula lenta*, *Magnolia fraseri*, *Acer rubrum*, and *Tilia americana* var. *heterophylla*. Other shrub species may include *Kalmia latifolia*, *Leucothoe fontanesiana*, *Lindera benzoin*, and *Ilex opaca* var. *opaca*. Herbaceous cover is typically sparse.

#### Great Smoky Mountains National Park

This forest is dominated by *Pinus strobus* and *Tsuga canadensis*. Other species that may have coverage in the subcanopy include *Acer rubrum, Liriodendron tulipifera, Magnolia fraseri, Oxydendrum arboreum,* and *Quercus alba*. The tall-shrub stratum is dominated by *Rhododendron maximum*. *Leucothoe fontanesiana* sometimes dominates a short-shrub stratum. Other shrubs can include *Calycanthus florida, Clethra acuminata, Ilex opaca, Kalmia latifolia,* and *Pyrularia pubera*. Herb coverage is sparse. Typical species include *Chimaphila maculata, Galax urceolata, Goodyera pubescens, Hexastylis arifolia* var. *ruthii,* and *Mitchella repens*.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK G4

RANK JUSTIFICATION

DATABASE CODE CEGL007102

#### **COMMENTS**

#### Globally

Similar forests in Kentucky lack *Leucothoe fontanesiana* and have *Magnolia macrophylla* rather than *Magnolia fraseri*. This forest is common in the Chattooga River basin of South Carolina and Georgia.

## **Great Smoky Mountains National Park**

It is unclear if there is an environmental factor that distinguishes forests codominated by *Tsuga canadensis* and *Pinus strobus* and those dominated by only *Tsuga canadensis*. It is possible that those codominated by *Pinus strobus* occur on drier, more westerly exposed sites or perhaps on previously disturbed sites. It is unlikely that the signature of this association will be distinguishable from that of *Tsuga canadensis* - *Liriodendron tulipifera* / *Rhododendron maximum* / *Tiarella cordifolia* Forest (CEGL007136).

#### **RANGE**

#### Globally

The potential range of this community is in the mountains and upper Piedmont from Pennsylvania to northern Georgia. It is known from the lower elevations of the Blue Ridge escarpment region, the western margin of the Blue Ridge, and on dry upper slopes in the Ridge and Valley and Cumberland Mountains. It occurs in Georgia, North Carolina, South Carolina, Tennessee, Kentucky, and may possibly occur in Alabama, Maryland, Pennsylvania, Virginia, and West Virginia.

#### Great Smoky Mountains National Park

This association was sampled on the Cades Cove quadrangle but not found on the Mount Le Conte quadrangle. On the Cades Cove quadrangle it was sampled or observed on the northern half of the quadrangle, below 2300 feet elevation, on south-facing slopes and low ridges. It was found north of the Cades Cove Loop Road in the vicinity of Copper Road, Rich Mountain Road, Tater Ridge, and the lower slopes around Allnight Ridge. West and south of the Cades Cove Loop Road this associations was found on the southwest slopes above Forge Creek Road and on the south slopes and ridges of Boring Ridge. This community is more common elsewhere in the Park. Many historic samples from the western portion of the Park (Calderwood quadrangle) represent this community.

## ENVIRONMENTAL DESCRIPTION

#### **Globally**

This community occurs on narrow ridges and knobs, mid and upper slopes, bluff and cliff tops, and other exposed sites. It is found primarily on south-, southeast- or southwest-facing slopes on excessively drained, shallow soils, usually below 2000 feet elevation (at least in the southern Appalachians). Soils associated with this xeric forest are classified as Inceptisols, typically Lithic Dystrochrepts originating from sandstone, shale, and other noncalcareous parent material.

#### Great Smoky Mountains National Park

This community was found at elevations below 2300 feet on gentle to moderately steep slopes and low ridges. Sites supporting this community are exposed, typically with southern and western aspects. This forest is frequently fire-suppressed or affected by Southern pine beetle (*Dendroctonus frontalis*) and will have standing dead trees, thick litter layers, and much understory encroachment by hardwood species.

#### Great Smoky Mountains National Park

Pinus virginiana, Kalmia latifolia, Vaccinium pallidum, Vaccinium hirsutum, Vaccinium stamineum, Pteridium aquilinum, Tephrosia virginiana, Solidago odora.

#### VEGETATION DESCRIPTION

#### **Globally**

Includes forest vegetation of low ridges and slopes, where *Pinus virginiana* dominates the canopy or occurs with mixes of *Pinus rigida, Pinus echinata* or *Pinus strobus. Pinus pungens* may be present but is typically absent or only a very minor component. These forests have sparse to moderate shrub cover, dominated by deciduous ericads, typically *Vaccinium pallidum*, although *Kalmia latifolia* may be locally dominant in some stands. This is often a low-stature forest with a somewhat open to closed canopy. Small stems of *Quercus prinus, Quercus coccinea, Acer rubrum, Nyssa sylvatica*, and *Oxydendrum arboreum* are common in the subcanopy and sapling strata, particularly in areas where fire has been excluded. In southern parts of the range, *Quercus marilandica, Quercus falcata*, and *Quercus stellata* can be deciduous components. Other shrub species can include *Vaccinium stamineum, Gaylussacia ursina, Gaylussacia baccata, Sassafras albidum,* and (in southwestern North Carolina and southeastern Tennessee) *Vaccinium hirsutum.* Herbaceous cover is typically sparse. Characteristic species include *Galax urceolata, Hypoxis hirsuta, Baptisia tinctoria, Euphorbia corollata, Pityopsis graminifolia* var. *latifolia,* and *Pteridium aquilinum* var. *latiusculum.* 

### Great Smoky Mountains National Park

Forests with canopies dominated by *Pinus virginiana*, sometimes with lesser amounts of *Pinus rigida* or *Pinus echinata*. *Acer rubrum* often dominates the subcanopy. Other canopy and subcanopy trees increase with fire suppression and include *Quercus prinus*, *Quercus coccinea*, *Quercus alba*, *Quercus marilandica*, *Quercus velutina*, *Pinus strobus*, *Oxydendrum arboreum*, *Nyssa sylvatica*, and *Tsuga canadensis*. The tall-shrub stratum can be open to moderately dense and is typically dominated *by Kalmia latifolia* and/or *Vaccinium stamineum*. The short-shrub stratum is typically dense and dominated by *Vaccinium pallidum* and/or *Gaylussacia ursina*. Fire-suppressed examples often have dense *Pinus strobus* in the shrub stratum. Other shrubs include saplings of canopy and subcanopy species as well as *Ilex opaca*, *Viburnum acerifolium*, *Vaccinium hirsutum*, *Amelanchier laevis*, and *Sassafras albidum*. Common vines are *Smilax glauca* and *Smilax rotundifolia*. Herb cover is sparse, and leaf litter often dominates the ground layer. Typical species in the herb stratum are *Galax urceolata*, *Pteridium aquilinum*, *Schizachyrium scoparium*, *Epigaea repens*, *Chimaphila maculata*, and *Dichanthelium commutatum*.

## VEGETATION DESCRIPTION

#### **Globally**

This forest typically has a very dense canopy of *Pinus virginiana* and little understory. This successional forest is commonly associated with old fields, old pastures, clearcuts, and burned or eroded areas. Associated woody and herbaceous species vary with geography but are typically ruderal or exotic species.

## Great Smoky Mountains National Park

Pinus virginiana Successional Forests have a dense canopy of Pinus virginiana but may have an admixture of other successional species (Acer rubrum, Liriodendron tulipifera, Pinus strobus) as well has deciduous species from the surrounding forest vegetation (Quercus alba, Quercus velutina, Quercus coccinea). The understory is typically open with little herb or shrub coverage, although Tsuga canadensis or Pinus strobus may be locally dominant in the shrub strata. The forest floor is covered with leaf litter and coarse woody debris.

CLASSIFICATION CONFIDENCE LEVEL 1

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### Globally

This community occurs as island-like stands in the southern Appalachian Mountains of eastern Tennessee and western North Carolina. It is extremely limited in distribution and is restricted to the following mountain areas: Great Smoky Mountains, Black Mountains, Balsam Mountains, Plott Balsams, and Grandfather Mountain.

#### Great Smoky Mountains National Park

This community was not sampled or observed on the two pilot quadrangles, but it is likely within the Park boundary. It should be looked for at elevations above 6000 feet (1830 meters) on exposed sites (rocky ridges and steep, south-facing slopes).

#### ENVIRONMENTAL DESCRIPTION

#### Globally

These forests occur on rocky spurs, steep ridges, and south-facing slopes above 6000 feet (1830 m) elevation, often adjacent to montane shrublands. These forests occur on all topographic positions except the steepest rocky cliffs of the highest summits. Soils that support this community are classified as Inceptisols and are shallow, rocky, and often have a thick organic layer. Moisture regimes are mesic to wet, due to high rainfall, abundant cloud cover, fog deposition, and low temperatures. This forest may grade into forests dominated by *Picea rubens* and *Abies fraseri*, montane grasslands, high elevation shrublands, or high elevation rock outcrop communities.

#### Great Smoky Mountains National Park

No information

#### MOST ABUNDANT SPECIES

#### **Globally**

<u>Stratum</u> <u>Species</u> Tree canopy *Abies fraseri*

No information

#### CHARACTERISTIC SPECIES

### Globally

Abies fraseri, Rhododendron catawbiense, Rhododendron carolinianum, Rhododendron maximum

## Great Smoky Mountains National Park

No information

#### VEGETATION DESCRIPTION

#### **Globally**

This needle-leaved evergreen forest has greater than 75 percent canopy coverage by *Abies fraseri*. *Abies fraseri* in the canopy are 17-23 cm in diameter and 10-11 m tall, giving these forests a stunted appearance. Other species that may occur with low coverage in the canopy or subcanopy are *Picea rubens*, *Sorbus americana*, *Betula alleghaniensis*, *Prunus pensylvanica*. The tall-

shrub stratum is dominated by evergreen species and, although there may be considerable variation, is usually quite dense. Typical shrub dominants include *Rhododendron catawbiense*, *Rhododendron carolinianum*, and *Rhododendron maximum*. Herbaceous cover is typically sparse. On steep, rocky, northerly slopes, coverage by mosses, liverworts, and lichens can approach 100 percent. Bryophyte species include *Hylocomium splendens*, *Ptilium crista-castrensis*, *Sphagnum* spp., and *Polytrichum ohioense*.

#### Great Smoky Mountains National Park

No information

#### OTHER NOTEWORTHY SPECIES

Rare or regionally rare vascular plant species associated with this community include *Abies fraseri*, *Betula papyrifera* var. cordifolia, Cardamine clematitis, Glyceria nubigena, Phegopteris connectilis, Poa palustris, Rhododendron vaseyi, Stachys clingmanii, Streptopus amplexifolius. Rare non-vascular plants include *Bazzania nudicaulis*, *Brachydontium trichodes*, *Leptodontium excelsum*, *Metzgeria temperata*, *Nardia scalaris*, *Plagiochila corniculata*, and *Sphenolobopsis pearsonii*.

Animals endemic to high elevation areas of the southern Appalachians include Carolina Flying Squirrel (Glaucomys sabrinus coloratus), Yonahlossee Salamander Plethodon yonahlossee, Weller's Salamander (Plethodon welleri), Spruce-fir Moss Spider Microhexura montivaga. Rare animal species that are northern disjuncts include Black-capped Chickadee (Parus atricapillus, and Northern Saw-whet Owl (Aegolius acadicus). The spruce-fir moss spider (Microhexura montivaga G1) is specific to this community type. The spider populations seem to be decreasing with the decline of these forests. As the canopy thins, moss desiccation increases, thus affecting the spider's habitat.

An exotic insect, the Balsam Woolly Adelgid (*Adelges piceae*), invaded the southern Appalachians in the late 1950s and has drastically altered the last undisturbed remnants of this community. This exotic pest kills mature *Abies fraseri* within seven years of infestation.

#### CONSERVATION RANK G1

#### RANK JUSTIFICATION

This community has a naturally restricted distribution, occurring only on the highest elevation peaks of the southern Appalachian Mountains. It exists in only a small portion of its original range due to the impact of early 20th century, post-logging fires and the ongoing outbreak of the Balsam Woolly Adelgid, an exotic pest that infests and kills mature *Abies fraseri*. Well-developed, undisturbed examples of this community are extremely rare. Most remaining examples of this community exist as patches of dense young trees or dense *Rubus* thickets beneath forests of dead snags or tangles of fallen logs.

DATABASE CODE CEGL006308

#### **COMMENTS**

## Globally

This community may grade into forests dominated by *Picea rubens* and *Abies fraseri*, montane grasslands, high elevation shrublands, or high elevation rock outcrop communities.

## VEGETATION DESCRIPTION

#### **Globally**

This needle-leaved evergreen forest has at least 75 percent of the canopy coverage composed of *Abies fraseri*, typically with many standing dead stems. Canopy trees are of small diameter (less than 20 cm) and short stature (less than 10 m tall), giving these forests a stunted appearance. Other species that may occur in the canopy or subcanopy with low coverage are *Picea rubens*, *Sorbus americana*, *Betula alleghaniensis*, *Prunus pensylvanica*, and *Acer spicatum*. There may be considerable variation in the density of shrub cover, but it is typically low (<20 percent) and dominated by deciduous species. Typical shrub species include *Viburnum lantanoides*, *Vaccinium erythrocarpum*, *Sambucus racemosa* var. *pubens*, *Menziesia pilosa*, *Rubus allegheniensis*, and *Rubus idaeus* ssp. *strigosus*. Where shrubs are sparse, herb cover is usually dense, with *Oxalis montana*, *Athyrium filix-femina* ssp. *asplenioides*, and *Dryopteris campyloptera* often dominant. Other common herbs include *Aster acuminatus*, *Aster chlorolepis*, *Clintonia borealis*, *Solidago glomerata*, *Rugelia nudicaulis*, *Ageratina altissima* var. *roanensis*, *Chelone lyonii*, *Circaea alpina* ssp. *alpina*, *Streptopus roseus*, *Viola macloskeyi* ssp. *pallens*, *Geum radiatum*, and *Huperzia lucidula*. Mosses, liverworts, and lichens grow densely on fallen logs, tree trunks, and the forest floor, giving the community a distinctive carpeted appearance. Characteristic bryophyte species include *Hylocomium splendens*, *Ptilium crista-castrensis*, *Rhytidiadelphus triquetrus*, *Hylocomiastrum umbratum*.

#### Great Smoky Mountains National Park

This forest has a canopy strongly dominated by *Abies fraseri*, often with many standing dead and fallen individuals. Minor amounts of other tree species (*Picea rubens, Betula alleghaniensis, Prunus pensylvanica*, and *Sorbus americana*) may occur in the canopy, subcanopy, or as tall shrubs/saplings. The shrub stratum is typically open and sparse but can have moderately dense coverage, especially in areas disturbed by past logging, deer browsing, or Balsam Woolly Adelgid (*Adelges piceae*). Shrubs can include *Diervilla sessilifolia, Rubus canadensis, Sambucus racemosa* var. *pubens, Vaccinium erythrocarpum*, and *Viburnum lantanoides*. The shrub stratum may also have areas of dense *Abies fraseri* regeneration, particularly in areas of canopy tree mortality. The herbaceous stratum has moderately dense coverage, with ferns and tall forbs locally dominant. Typical herbaceous dominants include *Aster acuminatus, Athyrium filix-femina, Oxalis montana, Clintonia borealis, Dryopteris campyloptera*, and *Solidago glomerata*. Other herbaceous species include *Carex brunnescens, Carex debilis, Huperzia lucidula, Rugelia nudicaulis*, and, in seepage areas, *Chelone lyonii, Impatiens pallida*, and the shrub, *Ribes rotundifolia*. In stands with intact *Abies fraseri* canopies, mosses have high coverage on fallen logs, and tree trunks.

#### OTHER NOTEWORTHY SPECIES

An exotic insect, the Balsam Woolly Adelgid (*Adelges piceae*), invaded the southern Appalachians in the late 1950s and has drastically altered the last undisturbed remnants of this community. This exotic pest kills mature *Abies fraseri* within seven years of infestation.

Rare or regionally rare vascular plant species associated with this community include *Abies fraseri*, *Betula papyrifera* var. cordifolia, Cardamine clematitis, Glyceria nubigena, Phegopteris connectilis, Poa palustris, Rhododendron vaseyi, Stachys clingmanii, Streptopus amplexifolius. Rare non-vascular plants include *Bazzania nudicaulis*, *Brachydontium trichodes*, Leptodontium excelsum, Metzgeria temperata, Nardia scalaris, Plagiochila corniculata, Sphenolobopsis pearsonii.

Animals endemic to high elevation areas of the southern Appalachians include Carolina Flying Squirrel (Glaucomys sabrinus coloratus), Yonahlossee Salamander Plethodon yonahlossee, Weller's Salamander (Plethodon welleri), Spruce-fir Moss Spider Microhexura montivaga. Rare animal species that are northern disjuncts include Black-capped Chickadee (Parus atricapillus, and Northern Saw-whet Owl (Aegolius acadicus). The spruce-fir moss spider (Microhexura montivaga G1) is specific to this community type. The spider populations seem to be decreasing with the decline of these forests. As the canopy thins, moss desiccation increases, thus affecting the spider's habitat.

#### CONSERVATION RANK G1

#### RANK JUSTIFICATION

This community occurs as island-like stands in the southern Appalachian Mountains. It has a naturally restricted distribution and exists in only a small portion of its original range due to the impact of early 20th century, post-logging fires and the ongoing outbreak of the Balsam Woolly Adelgid (*Adelges piceae*). Well-developed, undisturbed examples of this community are extremely rare.

DATABASE CODE CEGL006049

#### **COMMENTS**

### Globally

This community may grade into forests dominated by northern hardwood species (*Betula alleghaniensis*, *Fagus grandiflora*, *Acer saccharum*) or forest codominated by *Picea rubens* and *Abies fraseri*. It may also occur adjacent to montane grasslands, high elevation shrublands, or high elevation rock outcrop communities. A similar forest, *Abies fraseri* / (*Rhododendron catawbiense - Rhododendron carolinianum*) Forest, has a canopy dominated by *Abies fraseri* but has a shrub stratum dominated by evergreen species.

#### Great Smoky Mountains National Park

On Mount Le Conte, this community occurs as discontinuous stands in a mosaic of standing dead *Abies fraseri* and areas variously dominated by shrubs (*Rubus canadensis* and/or *Diervilla sessilifolia*) or herbaceous species (*Athyrium filix-femina* and/or *Solidago glomerata*) – see *Rubus canadensis* - (*Rubus idaeus* ssp. *strigosus*) / *Solidago glomerata* - *Athyrium filix-femina* Shrubland (CEGL003893).

FORMATION Conical-crowned temperate or subpolar needle-leaved evergreen forest (I.A.8.N.c.)

ALLIANCE Abies fraseri - Picea rubens Forest Alliance

CLASSIFICATION CONFIDENCE LEVEL

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### Globally

This community is restricted to the highest mountain systems of the southern Appalachians in eastern Tennessee and western North Carolina. It is not known from Virginia but could possibly occur there.

#### Great Smoky Mountains National Park

This community was sampled on the Mount Le Conte quadrangle on steep, exposed, south-facing slopes in an area north of Mount Kephart known as "The Boulevard," on steep slopes above Rocky Spur, and on steep slopes on the southern flanks of Mount Le Conte. It does not occur on the Cades Cove quadrangle but is likely in other high elevation areas (above 5500 feet elevation) of the Park.

#### ENVIRONMENTAL DESCRIPTION

### **Globally**

This forest is best developed between 5100-6000 feet elevation (1550 and 1830 meters) but may occur at lower elevations and is typically found on moderately steep to steep, convex slopes. Soils are highly variable, from deep mineral soils to well-developed boulderfields, where a thin organic layer and moss mat overlie the rocks and there are pockets of mineral soil in deep crevices between boulders. The dominant soils are Inceptisols with scattered occurrences of Spodosols at the highest elevations (White *et al.* 1993). Generally, soils can be described as shallow and rocky, with well-developed organic and A horizons. All soils in these high elevation forests are low in base saturation, high in organic matter, and are acid in reaction (pH 3-5), with a high aluminum content. The moisture regimes of these areas are mesic to wet due to high rainfall, abundant cloud cover, fog deposition, and low temperatures. The climate has been classified as perhumid, with the temperature varying elevationally from mesothermal to microthermal. The regional geology is dominated by complexly folded metamorphic, sedimentary, and igneous rocks of the Precambrian and early Paleozoic age, including phyllites, slates, schists, sandstones, quartzites, granites, and gneisses.

### Great Smoky Mountains National Park

This community was found on steep, middle to high slopes at elevations between 5100 and 6000 feet (samples ranged in elevation from 5320 to 5780 feet) over organic soils with thick litter layers. In some areas ice storms and Balsam Woolly Adelgid (*Adelges piceae*) affect the canopy structure.

#### CHARACTERISTIC SPECIES

## Globallv

Picea rubens, Abies fraseri, Rhododendron catawbiense

## Great Smoky Mountains National Park

Picea rubens, Rhododendron catawbiense

#### **VEGETATION DESCRIPTION**

## Globally

This association includes forests of the southern Appalachians, within the range of *Abies fraseri*, dominated by *Picea rubens* with or without *Abies fraseri*. Other species may occur in the canopy/subcanopy but with low coverage. The shrub stratum is moderate to dense and dominated by evergreen species such as *Rhododendron catawbiense*, *Rhododendron maximum*, and *Rhododendron carolinianum*. Shrub coverage is most dense on drier, convex slopes. Other shrub species with minor coverage may include *Vaccinium simulatum*, *Vaccinium erythrocarpum*, *Viburnum nudum* var. *cassinoides*, *Diervilla sessilifolia*, and *Viburnum lantanoides*. Extensive patches of *Abies fraseri* seedlings and standing dead stems of *Abies fraseri* may be common. Herb coverage is typically low, but moist, north-facing sites may have *Oxalis montana*, *Athyrium filix-femina* ssp. *asplenioides*, *Dryopteris campyloptera*, and mosses dominating beneath the shrub stratum.

#### Great Smoky Mountains National Park

This community has a closed canopy dominated by large *Picea rubens*. Some occurrences may have standing dead *Abies fraseri* and a more open canopy due to *Abies* mortality or damage by ice storms. The subcanopy may have scattered stems of *Betula alleghaniensis* or *Prunus pensylvanica*, but these species form a minor part of the canopy coverage (less than 25 percent). The shrub stratum is dense (70-100 percent coverage) and dominated by *Rhododendron catawbiense*. In some occurrences on the flanks of Mount Le Conte, *Leucothoe fontanesiana* can dominate the short-shrub stratum. Other species that may be present as a minor part of the shrub stratum include *Abies fraseri*, *Ilex montana*, *Kalmia latifolia*, *Picea rubens*, *Rhododendron maximum*, *Rubus canadensis*, *Sorbus americana*, *Vaccinium corymbosum*, *Vaccinium erythrocarpum*, and *Viburnum lantanoides*. The herbaceous stratum is sparse, typically with less than 10 percent coverage. Herbaceous species include *Aster acuminatus*, *Athyrium filix-femina*, *Dryopteris campyloptera*, *Dryopteris intermedia*, *Monotropa uniflora*, and *Oxalis montana*. The ground cover is dominated by thick and spongy litter and duff layers and by downed woody debris.

#### OTHER NOTEWORTHY SPECIES

Rare or regionally rare vascular plant species associated with this community include Abies fraseri, Betula papyrifera var. cordifolia, Botrychium oneidense, Calamagrostis canadensis, Cardamine clematitis, Carex projecta, Carex ruthii, Chelone lyonii, Geum geniculatum, Glyceria nubigena, Phegopteris connectilis, Poa palustris, Prenanthes roanensis, Rhododendron carolinianum,, Rugelia nudicaulis, Stachys clingmanii, Stellaria corei, and Streptopus amplexifolius. Rare non-vascular plants include Bazzania nudicaulis, Brachydontium trichodes, Gymnoderma lineare, Leptodontium excelsum, Metzgeria temperata, Nardia scalaris, Plagiochila corniculata, and Sphenolobopsis pearsonii.

Animals endemic to high elevation areas of the southern Appalachians include Carolina Flying Squirrel (Glaucomys sabrinus coloratus), Yonahlossee Salamander Plethodon yonahlossee, Weller's Salamander (Plethodon welleri), Spruce-fir Moss Spider Microhexura montivaga. Rare animal species that are northern disjuncts include Black-capped Chickadee (Parus atricapillus, and Northern Saw-whet Owl (Aegolius acadicus). The spruce-fir moss spider (Microhexura montivaga) is specific to this community type. The spider populations seem to be decreasing with the decline of these forests. As the canopy thins, moss desiccation increases, thus affecting the spider's habitat.

This community provides breeding habitat for many migrant landbird species. Typical bird species that utilize this habitat include Canada Warbler (*Wilsonia canadensis*), Black-throated Blue Warbler (*Dendroica caerulescens*), Blackburnian Warbler (*Dendroica fusca*), Black-throated Green Warbler (*Dendroica virens*), Gray Catbird (*Dumetella carolinensis*), Verry (*Catharus fuscescens*), and Solitary Vireo (*Vireo solitarius*).

An exotic insect, the Balsam Woolly Adelgid (*Adelges piceae*), invaded the southern Appalachians in the late 1950s and has drastically altered the last undisturbed remnants of this community. This exotic pest kills mature *Abies fraseri* within seven years of infestation.

### CONSERVATION RANK G1

## RANK JUSTIFICATION

This community has a naturally restricted distribution and has been subject to major acreage reduction during the early part of the 20th century and rapid condition decline in the past 30 years. Modern threats include atmospheric pollution deposition and damage by *Adelges piceae*, the exotic Balsam Woolly Adelgid. Well-developed, undisturbed examples of this community are extremely rare.

DATABASE CODE CEGL007130

#### **COMMENTS**

#### Globally

A similar forest, *Picea rubens – (Abies fraseri) / Vaccinium erythrocarpum / Oxalis montana - Dryopteris campyloptera - Hylocomium splendens* Forest (CEGL007131), has an understory dominated by deciduous shrubs, herbs, and bryophtyes and occurs on more mesic sites than the one described here. Similar forests occur in the central and northern Appalachians but have *Abies balsamea* as the fir component, less dense herb and bryophyte cover, and lack a *Rhododendron*-dominated understory (Oosting and Billings 1951; Whittaker 1956; Crandell 1958).

As a result of human disturbance, primarily large-scale corporate logging (1880-1930), sometimes followed by fire and massive soil erosion, present day *Picea rubens* and *Abies fraseri* vegetation in the southern Appalachians is estimated to cover only 48 percent (69 square kilometers) of the presettlement area (Cogbill and White 1991).

#### Great Smoky Mountains National Park

On the Mount Le Conte quadrangle, this forest grades into forests dominated by *Picea rubens* and *Betula alleghaniensis* or forests dominated by *Picea rubens, Tsuga canadensis*, and *Betula alleghaniensis*. Some occurrences of this community may be floristically similar to *Picea rubens - (Betula alleghaniensis, Aesculus flava) / Viburnum lantanoides / Oxalis montana - Solidago glomerata* Forest (CEGL006256). Examples on the Mount Le Conte quadrangle include stands of old-growth forest.

#### Great Smoky Mountains National Park

Picea rubens, Abies fraseri, Rubus allegheniensis, Clintonia borealis, Oxalis montana, Solidago glomerata, Vaccinium erythrocarpum

#### VEGETATION DESCRIPTION

#### Globally

These forests are dominated by needle-leaved evergreen trees and have a characteristic understory of southern Appalachian endemic species and a conspicuous bryophyte layer. Canopies are dominated by *Picea rubens*, with or without *Abies fraseri*, sometimes with lesser amounts of *Betula alleghaniensis* and *Sorbus americana*. The subcanopy contains canopy species as well as *Acer spicatum* and *Amelanchier laevis*. The shrub strata are dominated by deciduous species and can be sparse to dense. Typical shrub species include *Viburnum lantanoides*, *Vaccinium erythrocarpum*, *Vaccinium simulatum*, *Sambucus racemosa* var. *pubens*, *Rubus allegheniensis*, *Ilex montana*, *Rhododendron catawbiense*, and *Rubus canadensis*. Extensive patches of *Abies fraseri* seedlings and standing dead stems of *Abies fraseri* are common. Herb density can be high but is inversely related to the density of the shrub layer. Common herbaceous species include *Oxalis montana*, *Athyrium filix-femina* ssp. *asplenioides*, *Dryopteris campyloptera*, and *Clintonia borealis*. Other herbs include *Aster acuminatus*, *Aster chlorolepis*, *Carex gynandra*, *Carex pensylvanica*, *Chelone lyonii*, *Circaea alpina* ssp. *alpina*, *Houstonia serpyllifolia*, *Huperzia lucidula*, *Maianthemum canadense*, *Rugelia nudicaulis*, *Solidago glomerata*, *Solidago glomerata*, *Streptopus roseus* var. *roseus*, and *Viola macloskeyi* ssp. *pallens*. Bryophytes and lichens make up a considerable percent of the vegetative coverage in this community, occurring on the surface of the soil, trees, and fallen logs. Characteristic non-vascular species include *Hylocomium splendens*, *Ptilium cristacastrensis*, *Leptodontium excelsum*, *Bazzania trilobata*, *Bazzania nudicaulis*, *Alectoria fallacina*, *Hypotrachyna virginica*, *Dicranum fuscescens*.

#### Great Smoky Mountains National Park

These forests have canopies that are strongly dominated by *Picea rubens* and rather open due to *Abies fraseri* mortality. The shrub strata are dense and composed of a mix of deciduous shrubs and regenerating *Picea rubens* and *Abies fraseri*. Other shrub species include *Amelanchier laevis*, *Betula alleghaniensis*, *Diervilla sessilifolia*, *Menziesia pilosa*, *Prunus pensylvanica*, *Vaccinium erythrocarpum*, *Rubus alleghaniensis*, *Sambucus racemosa* var. *pubens.*, *Sorbus americana*, and *Viburnum lantanoides*. Standing dead trees are common, as is abundant coarse woody debris on the forest floor. The litter layer is thick, and bryophyte cover can be high, while herbaceous cover is sparse. Herbaceous species include *Aster acuminatus*, *Athyrium filix-femina*, *Clintonia borealis*, *Dennstaedtia punctilobula*, *Dryopteris campyloptera*, *Oxalis montana*, *Solidago glomerata*, and *Viola blanda*.

#### OTHER NOTEWORTHY SPECIES

Rare or regionally rare vascular plant species associated with this community include Abies fraseri, Betula papyrifera var. cordifolia, Botrychium oneidense, Calamagrostis canadensis, Cardamine clematitis, Carex projecta, Carex ruthii, Chelone lyonii, Geum geniculatum, Glyceria nubigena, Phegopteris connectilis, Poa palustris, Prenanthes roanensis, Rugelia nudicaulis, Stachys clingmanii, Stellaria corei, and Streptopus amplexifolius. Rare non-vascular plants include Bazzania nudicaulis, Brachydontium trichodes, Gymnoderma lineare, Leptodontium excelsum, Metzgeria temperata, Nardia scalaris, Plagiochila corniculata, and Sphenolobopsis pearsonii.

Animals endemic to high elevation areas of the southern Appalachians include Carolina Flying Squirrel (Glaucomys sabrinus coloratus), Yonahlossee Salamander Plethodon yonahlossee, Weller's Salamander (Plethodon welleri), Spruce-fir Moss Spider Microhexura montivaga. #### **COMMENTS**

#### Globally

This association may not be distinct enough from *Picea rubens / Rhododendron maximum* Forest (CEGL006152) to warrant recognition from it. Forests with *Picea rubens* and *Tsuga canadensis* occur in Virginia but in a different topographic and hydrologic situation than this association. Occurrences at Salt Pond Mountain, Virginia, are in valley bottoms, within streamheads, and have an unclear hydrology.

## Great Smoky Mountains National Park

On the Mount Le Conte quadrangle, these forests may grade into lower elevation forests dominated by *Betula alleghaniensis* or *Tsuga canadensis*. At least some examples are old-growth forest. On more exposed sites, this community may border heath shrublands.

ALLIANCE Tsuga canadensis Forest Alliance

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM Upland

#### RANGE

#### **Globally**

This community occurs in the mountains of Georgia, North Carolina, South Carolina, and Tennessee, and the Cumberland Plateau of Kentucky, and may range into Virginia.

#### Great Smoky Mountains National Park

This community was sampled on the Cades Cove quadrangle. It is unlikely to occur on the Mount Le Conte quadrangle but may occur elsewhere in the Park. This community was sampled in two locations on the Cades Cove quadrangle; in the northwest along More Licker Branch and in the central portion of the quadrangle along Tipton's Sugar Cove Branch.

#### ENVIRONMENTAL DESCRIPTION

#### **Globally**

This forests occurs on lower or protected slopes and terraces at elevations greater than 1800 feet.

### Great Smoky Mountains National Park

This forest is found in association with streams on low slopes with north aspects. Samples were from 1705 and 2277 feet elevation, but this forest is likely to occur at higher elevations.

#### VEGETATION DESCRIPTION

## Globally

Forests of lower or protected slopes and terraces with *Tsuga canadensis* occurring over a dense to patchy shrub stratum of *Rhododendron maximum*. Other canopy species of minor importance may include *Liriodendron tulipifera*, *Tilia americana* var. *heterophylla*, *Pinus strobus*, *Betula lenta*, *Magnolia fraseri*, *Acer rubrum*, and *Fraxinus americana*, and total less than 25 percent of the canopy cover. *Leucothoe fontanesiana* is often a shrub component and sometimes occurs densely. Other typical shrubs include *Ilex opaca*, *Clethra acuminata*, and *Kalmia latifolia*. Herbs are sparse to moderate, depending on the shrub cover. Typical herbs include *Chimaphila maculata*, *Goodyera pubescens*, *Medeola virginiana*, *Hexastylis shuttleworthii*, *Mitchella* 

repens, Polystichum acrostichoides, and Galax urceolata. Bryophyte cover is often dense.

### Great Smoky Mountains National Park

The canopy of this community is strongly dominated by *Tsuga canadensis*. Other species that have minor coverage in the canopy and subcanopy include *Betula lenta*, *Magnolia fraseri*, and *Liriodendron tulipifera*. The dominant shrubs are *Rhododendron maximum* and *Leucothoe fontanesiana*. Other shrubs include *Hamamelis virginiana*, *Halesia tetraptera* var. *monticola*, *Clethra acuminata*, and *Oxydendrum arboreum*. Herbs are sparse; typical species include *Dryopteris intermedia*, *Goodyera pubescens*, *Medeola virginiana*, *Mitchella repens*, *Mitchella repens*, *Polystichum acrostichoides*, and *Thelypteris noveboracensis*.

DATABASE CODE CEGL007136

#### **COMMENTS**

#### Globally

In Kentucky, this association occurs the eastern part of the state (Appalachian Plateaus, Cumberland Mountains), and may occur disjunct in the Shawnee Hills. In Kentucky, disturbed areas may have abundant *Betula lenta* and *Betula alleghaniensis* in the subcanopy.

## Great Smoky Mountains National Park

This association can occur adjacent to and grade in and out of *Tsuga canadensis - Liriodendron tulipifera / Rhododendron maximum / Tiarella cordifolia* Forest (CEGL007543). It is unclear if there is an environmental factor that distinguishes forests codominated by *Tsuga canadensis* and *Pinus strobus* and those dominated by only *Tsuga canadensis*. It is possible that those codominated by *Pinus strobus* occur on drier, more westerly exposed sites or perhaps on previously disturbed sites. It is unlikely that the signature of this association can be distinguished from that of *Pinus strobus - Tsuga canadensis / Rhododendron maximum - Leucothoe fontanesiana* Forest (CEGL007102).

#### **Globally**

This community occurs in the southern Blue Ridge of Georgia, North Carolina, Tennessee, and Virginia.

## Great Smoky Mountains National Park

This community was sampled on the Mount Le Conte and Cades Cove quadrangles. Additional historic samples are from the Thunderhead Mountain quadrangle. On the Cades Cove quadrangle, historic and recent samples of this community ranged from 3580 to 4610 feet elevation. Samples from the southern portion of the Cades Cove quadrangle came from upper coves north of Gregory Bald; slopes below Rich Gap; and the western slopes of Forge Knob. In the central and eastern portion of the Cades Cove quadrangle this community was sampled from the protected high slopes on the west side of Mud Gap; a cove north of Ekaneetlee Gap; high slopes in the vicinity of Devil's Tater Patch; McCampbell Gap, McCampbell Knob, an upper cove north of McCampbell Gap; northwest slopes below McCampbell Knob; and a cove in the upper reaches of Pole Knob Branch. This community was sampled in the southwest portion of the Mount Le Conte quadrangle on the low slopes above Alum Cave Creek (4050 feet) and Walker Camp Prong (3990 feet); on the low slopes above Road Prong in the vicinity of Beech Flats (3650 feet); and in a upper cove below Chimney Tops (4620 feet).

#### ENVIRONMENTAL DESCRIPTION

#### Globally

This forest occurs on deep, rocky soils on the upper slopes of coves and on other protected landforms, at elevations 3500-5000 feet and can be associated with mafic substrates.

#### Great Smoky Mountains National Park

This community occurs on concave or protected landforms such as the upper portions of draws and coves, protected slopes, and gaps. Sites sampled had northerly aspects and a mean elevation of 4200 feet, ranging from 3580 to 4620 feet.

No information

## Great Smoky Mountains National Park

Betula alleghaniensis, Fagus grandifolia, Acer saccharum, Halesia tetraptera var. monticola, Deparia acrostichoides, Viola

canadensis

#### VEGETATION DESCRIPTION

## Globally

This forest is dominated by species typically known as "northern hardwoods" (Aesculus flava, Fagus grandifolia, Betula alleghaniensis, Acer saccharum) and has a rich herbaceous flora dominated by forbs. Other canopy species can include Tilia americana var. heterophylla and Quercus rubra. In the Great Smoky Mountains, Halesia tetraptera var. monticola is an important canopy component. The shrub stratum is typically open, but small trees such as Acer spicatum, Acer pensylvanicum, and Amelanchier laevis are common. Herbaceous cover can be lush, quite diverse, and is typically dominated and characterized by large forbs such as Caulophyllum thalictroides, Cimicifuga racemosa, Collinsonia canadensis, Ageratina altissima var. roanensis, Laportea canadensis, Campanulastrum americanum, and Tiarella cordifolia.

#### Great Smoky Mountains National Park

The canopy of these forests always have a component of Betula alleghaniensis and Fagus grandifolia, codominating with Acer saccharum, Aesculus flava, and Halesia tetraptera var. monticola. Occasionally Quercus rubra, Tilia americana var. heterophylla, and Fraxinus americana may have coverage in the canopy, but this situation is not typical. The subcanopy, if present, contains species from the canopy as well as Prunus pensylvanica and Prunus serotina. The shrub stratum is typically open with scattered shrubs, but shrubs can dominate in patches. Typical shrub species include Acer pensylvanicum, Acer saccharum, Acer spicatum, Aesculus flava, Cornus alternifolia, Fagus grandifolia, Hydrangea arborescens, Ilex montana, Rubus allegheniensis, Rubus canadensis, and Viburnum lantanoides. The herbaceous stratum is lush and diverse. Species with the highest coverage and constancy include Ageratina altissima (var. altissima and var. roanensis), Aster divaricatus, Cimicifuga americana, Cimicifuga racemosa, Deparia acrostichoides, Dryopteris intermedia, Laportea canadensis, Solidago caesia var. curtisii, Tiarella cordifolia, and Viola blanda. Other species with greater than 50 percent constancy include Arisaema triphyllum ssp. triphyllum, Athyrium filix-femina ssp. asplenioides, Carex spp. (e.g. Carex aestivalis, Carex debilis, Carex laxiflora var. laxiflora, Carex pensylvanica, Carex plantaginea), Disporum lanuginosum, Eupatorium spp. (e.g. Eupatorium dubium, Eupatorium fistulosum, Eupatorium purpureum, Eupatorium steelei), Galium spp. (e.g. Galium lanceolatum, Galium latifolium, Galium triflorum), Impatiens spp., Polygonatum pubescens, Polystichum acrostichoides var. acrostichoides, Stellaria corei, Stellaria pubera, and Viola canadensis.

RANK JUSTIFICATION No information

DATABASE CODE CEGL004973

## **COMMENTS**

#### Globally

These forests occur above the elevational limit of some of the typical "cove" canopy species such as *Fraxinus americana*, *Liriodendron tulipifera*, and *Carya cordiformis* (see the *Liriodendron tulipifera* - *Tilia americana* var. *heterophylla* - *Aesculus flava* - *Acer saccharum* Forest Alliance).

#### Great Smoky Mountains National Park

Some examples of this community, particularly at low elevations, may begin to resemble forests in the *Liriodendron tulipifera-Tilia americana* var. *heterophylla - Aesculus flava - Acer saccharum* Forest Alliance. The canopy of this forest is distinguished by *Betula alleghaniensis* and *Fagus grandifolia* occurring in combination with *Aesculus flava* and Acer *saccharum*. In some areas, signature distinctions between this association and *Betula alleghaniensis - Fagus grandifolia - Aesculus flava / Viburnum lantanoides / Aster chlorolepis - Dryopteris intermedia* Forest (CEGL007285) may be difficult to make and mapping may have to be done at the alliance level.

#### VEGETATION DESCRIPTION

#### **Globally**

The canopy is dominated by various mixtures of *Betula alleghaniensis*, *Fagus grandifolia*, and sometimes *Aesculus flava*. Other canopy trees may be present but are of minor importance (e.g. Acer saccharum, Prunus serotina, Quercus rubra, Halesia tetraptera var. monticola). Common subcanopy trees include Acer pensylvanicum, Acer spicatum, and Acer saccharum. A shrub stratum may be absent to moderately dense. Viburnum lantanoides is a common shrub. Other possible shrub species include, but are not limited to, Hydrangea arborescens, Ilex montana, Rubus canadensis, and Sambucus racemosa var. pubens. Herbaceous cover can be dominated by sedges or ferns or be comprised of a mixture of sedges, ferns, and other forbs. Typical herbaceous species include Ageratina altissima var. roanensis, Aster chlorolepis, Athyrium asplenioides, Carex pensylvanica, Dryopteris intermedia, Solidago caesia var. curtisii, Stellaria pubera, Stellaria corei, and Streptopus roseus.

## Great Smoky Mountains National Park

The canopy is dominated by various mixtures of Betula alleghaniensis, Fagus grandifolia, and Aesculus flava. Other species that may occasionally have high coverage in the canopy include Halesia tetraptera var. monticola, Quercus rubra, and Acer saccharum. The subcanopy is usually not well-developed and consists of canopy species. Additional species that may be present in the subcanopy include Acer pensylvanicum, Amelanchier laevis, and Prunus serotina. At the highest elevations Picea rubens may be part of the subcanopy, while at lower elevations Magnolia acuminata may be present in the subcanopy. Shrubs are typically sparse but can be moderately dense. Common shrubs include Fagus grandifolia, Rubus canadensis, Acer spicatum, Viburnum lantanoides, and Ilex montana, although other species may occur. Herb coverage varies between occurrences but is composed of a mix of sedges, ferns, and other forbs. Species richness is low in comparison with other deciduous forests, with typically less than 30 total species per 0.1 hectare. Common herbaceous dominants include Ageratina altissima, Athyrium filix-femina ssp. asplenioides, Carex spp. (e.g. Carex debilis, Carex intumescens, Carex pensylvanica), and Dryopteris intermedia. Other typical herbs include Aster divaricatus, Solidago caesia var. curtisii, Stellaria pubera, and Viola spp. (e.g. Viola blanda, Viola canadensis, Viola hastata, Viola pubescens), although other species may occur.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK G3G4

## RANK JUSTIFICATION

This is a broadly defined association meant to cover typical "northern hardwood forests" of the southern Blue Ridge. If needed, more associations may be defined based on differences related to geology and other environmental variables. If broadly defined, this type is limited in distribution to western North Carolina, eastern Tennessee, and southwestern Virginia, and in extent by its requirement for higher elevations (typically over 4000 feet). Most of the area of this community type is on public lands administered by the U.S. Forest Service (Pisgah, Nantahala, Cherokee, and Jefferson national forests) and National Park Service (Great Smoky Mountains National Park and Blue Ridge Parkway). Most sites for this community are relatively secure from most threats. Exotic plants and animals, such as garlic mustard (*Alliaria petiolaris*) and the gypsy moth, may represent significant threats to this community.

DATABASE CODE CEGL007285

## **COMMENTS**

#### Globally

This is a broadly defined association meant to cover typical "northern hardwood forests" of the southern Blue Ridge. If needed, more associations may be defined based on differences related to geology and other environmental variables. This association differs from *Aesculus flava - Betula alleghaniensis - Acer saccharum / Acer spicatum / Caulophyllum thalictroides - Laportea canadensis* Forest (CEGL004973) by occurring on more exposed landforms and having floristic differences related to the lower moisture regime and less nutrient-rich soils.

#### Great Smoky Mountains National Park

Lower elevation examples of this community on Cades Cove (below 4600 feet) have high canopy coverage by *Quercus rubra* and may grade into forests in the *Quercus rubra* Montane Forest Alliance. Examples are often disturbed by European Wild Boar (*Sus scrofa*).

#### **RANGE**

#### **Globally**

This community is distributed in the moderate to high elevation (2000-4000 feet) regions of the Blue Ridge and Cumberland Mountains, and could possibly extend into the adjacent Ridge and Valley and Appalachian Plateau provinces. It occurs in Georgia, Kentucky, North Carolina, and Tennessee, and could possibly extend into Virginia.

#### Great Smoky Mountains National Park

This association was found on both the Cades Cove and Mount Le Conte quadrangles, and it should occur elsewhere in the Park on boulderfields below 5000 feet elevation. It was sampled on the southwestern portion of the Cades Cove quadrangle, at the headwaters of Forge Knob Branch. On the southwestern portion of the Mount Le Conte quadrangle, this association was sampled southwest of Rocky Spur in the vicinity of Le Conte Creek and also southwest of Balsam Point. This community was also sampled in the central portion of the Mount Le Conte quadrangle, in a north-facing ravine west of Trillium Gap.

## ENVIRONMENTAL DESCRIPTION

#### Globally

This community occurs in a cool, humid climate, on steep, rocky, northwest- to northeast-facing, middle to upper concave slopes, or in saddles between ridges, at moderate to high elevation (2000-4000 feet). These forests grow over bouldery talus and are often associated with small streams and seepage.

#### Great Smoky Mountains National Park

This community was found on steep to moderately steep slopes, in draws, and on periglacial boulderfields from 4000 to 5000 feet elevation. Aspects were north and west. Disturbance by wind and ice is common. There is little soil development, and the substrate is rubble, large rocks, and boulders. This community is associated with small creeks and seeps.

Betula alleghaniensis, Aesculus flava, Betula lenta, Acer spicatum, Hydrangea arborescens, Ribes cynosbati, Dryopteris marginalis, Aristolochia macrophylla

### Great Smoky Mountains National Park

Betula alleghanensis, Acer spicatum, Euonymus obovata, Polypodium appalachianum

#### VEGETATION DESCRIPTION

#### **Globally**

This forest is usually strongly dominated by *Betula alleghaniensis*, though other species such as *Aesculus flava, Betula lenta*, and *Tilia americana* var. *heterophylla* may also be common. *Betula alleghaniensis* in the canopy are often stunted and gnarled, with roots that may have grown to encircle the boulders. Tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. A woody layer of shrubs and vines is usually well-developed, because of the development of this community on periglacial boulderfields of blocky talus, limiting rooting opportunities for most herbaceous plants. Typical shrubs and vines, which are more abundant in this type than in other associations include *Acer spicatum, Aristolochia macrophylla, Hydrangea arborescens, Parthenocissus* quinquefolia, *Ribes cynosbati*, and *Ribes rotundifolium. Dryopteris marginalis* is often an abundant herb.

## Great Smoky Mountains National Park

This forest has a canopy dominated by Betula alleghaniensis and/or Aesculus flava. Betula alleghaniensis in the canopy are often stunted and gnarled, with roots that may have grown to encircle the boulders. Tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. Other species in the canopy and subcanopy can include Tilia americana var. heterophylla, Fagus grandifolia, Acer saccharum, Acer spicatum, Tsuga canadensis, and Picea rubens. Shrub density is typically high but may vary between occurrences. The shrub stratum is dominated by the tall shrub Acer spicatum and the short shrubs Hydrangea arborescens and Euonymus obovata. Ribes rotundifolium and Ribes cynosbati are conspicuous in the shrub stratum. Other shrubs include Viburnum lantanoides, Sambucus racemosa var pubens, and Rubus canadensis. Herb cover is moderate to dense, and herb strata tend to be diverse. Herbs and mosses cover the rocks and boulders. Dryopteris intermedia, Stellaria pubera, and the epiphyte Polypodium appalachianum are the most constant species in the stands sampled. Other common herbs include Ageratina altissima var. roanensis, Allium tricoccum, Angelica triquinata, Arisaema triphyllum, Aster chlorolepis, Cimicifuga americana, Diphylleia cymosa, Galium triflorum, Hydrophyllum canadense, Laportea canadensis, Melanthium parviflorum, Oxalis montana, Solidago caesia var curtisii, Tiarella cordifolia, and Trillium erectum.

#### OTHER NOTEWORTHY SPECIES

## CONSERVATION RANK G3

#### RANK JUSTIFICATION

This community is scattered throughout the high mountains but fairly uncommon. Unlike many other forest types in the southern Appalachians, this community has not historically been a threatened by logging because of the stunted nature of the trees and the inaccessibility, to loggers, of boulderfields.

DATABASE CODE CEGL004982

#### **COMMENTS**

## Globally

This type is conceptually similar to *Betula alleghaniensis / Ribes glandulosum / Polypodium appalachianum* Forest (CEGL006124), which is more restricted to very moist boulderfield situations at high elevations (4500-5300 feet). *Betula alleghaniensis / Acer spicatum / Hydrangea arborescens - Ribes cynosbati / Dryopteris marginalis* Forest generally occurs at lower elevations in less extreme environmental situations and lacks species characteristic of high elevations. Similar *Betula alleghaniensis*-dominated forests occur on glaciated rocky slopes in the upper mid-Atlantic and in the northeastern United States. The *Betula alleghaniensis*-dominated periglacial boulderfields of the southern Appalachian Mountains are distinguished from the northern forests by the occurrence of southern Appalachian endemic species, better developed shrub layers, and slightly less species diversity.

## **Great Smoky Mountains National Park**

Examples of this community in the Great Smoky Mountains National Park, particularly ones at high elevations, are compositionally similar to *Betula alleghaniensis / Ribes glandulosum / Polypodium appalachianum* Forest (CEGL006124). In the Park, this latter community is distinguished by occurring over 5000 feet elevation and by the occurrence of high elevation species such as *Abies fraseri, Dryopteris campyloptera, Ribes glandulosum, Rugelia nudicaulis, Streptopus amplexifolius, Prunus pensylvanica*, and *Sorbus americana*.

CLASSIFICATION CONFIDENCE LEVEL 1

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### Globally

This community is known from the high elevation regions of the Blue Ridge from West Virginia south to eastern Tennessee and western North Carolina and may extend into the adjacent Ridge and Valley and Appalachian Plateau provinces.

#### Great Smoky Mountains National Park

This community was sampled on the Mount Le Conte quadrangle and was not found on the Cades Cove quadrangle. It is likely in other areas of the Park and should be sought on steep slopes and boulderfields at elevations over 5000 feet, particularly in areas adjacent to spruce (*Picea rubens*) and fir (*Abies fraseri*) forests. On the Mount Le Conte quadrangle, this community was sampled on the north slope of Mount Le Conte, on the Rainbow Falls Trail, at 5300 feet elevation.

#### ENVIRONMENTAL DESCRIPTION

#### **Globally**

This community occurs in a cool, humid climate, on steep, boulder-strewn slopes, northwest- to northeast-facing, middle to upper concave slopes, or in saddles between ridges, at elevations of 1370 to 1600 meters (4500-5300 feet). Seepage areas are common, producing wet microhabitats with unique species assemblages. High winds and ice storms periodically affect these forests.

#### Great Smoky Mountains National Park

This community is found on steep, north-facing, periglacial boulderfields, above 5000 feet elevation. Disturbance by ice and wind is common.

#### VEGETATION DESCRIPTION

#### Globally

This community is distinguished by a closed to somewhat open canopy dominated by *Betula alleghaniensis*, occurring over angular rocks (0.25 to > 1 m diameter) covered by thin soil, lichens, mosses or vines. The rocks may be almost totally covered by moss. *Betula alleghaniensis* in the canopy are often stunted and gnarled, with roots that may have grown to encircle the boulders. Tree density is typically less than that of the surrounding forests. Other species that may form a minor canopy component include *Tilia americana* var. *heterophylla*, *Aesculus flava*, *Picea rubens*, *Sambucus racemosa* var. *pubens*, or *Quercus rubra*. Tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. The shrub density is typically high but may vary between occurrences. Herbaceous cover is generally sparse because of thin, rocky soil. Characteristic species in both the herb and shrub strata include *Acer spicatum*, *Acer pensylvanicum*, *Aster acuminatus*, *Ilex montana*, *Vaccinium erythrocarpum*, *Amelanchier arborea* var. *austromontana*, *Ribes glandulosum*, *Oxalis montana*, *Aster chlorolepis*, *Aconitum reclinatum*, *Carex aestivalis*, *Hylocomium splendens*, *Circaea alpina*, *Lonicera canadensis*, *Claytonia caroliniana*, *Cystopteris protrusa*, and *Dryopteris marginalis*. Seepage areas are common, producing wet microhabitats with unique species assemblages (*Chelone lyonii*, *Chrysosplenium americanum*, *Circaea alpina*, *Rudbeckia laciniata*, *Impatiens pallida*, and *Monarda didyma*).

#### Great Smoky Mountains National Park

This forest has a canopy strongly dominated by *Betula alleghaniensis*. Canopy trees are often stunted and gnarled, with roots that may have grown to encircle the boulders. Tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. Other species in the canopy and subcanopy can include *Aesculus flava, Prunus pensylvanica, Sorbus americana*, *Acer spicatum*, and *Picea rubens*. The shrub stratum is dominated by *Acer spicatum*, *Hydrangea arborescens, Viburnum lantanoides*, and *Ribes glandulosum*. Other shrubs include *Sambucus racemosa* var. *pubens*, *Diervilla sessilifolia, Lonicera canadensis, Vaccinium erythrocarpum, Ribes rotundifolium*, and *Rubus canadensis*. Herbs and mosses cover the rocks and boulders. Characteristic herbaceous species include *Aster chlorolepis, Dryopteris campyloptera, Cimicifuga americana, Clintonia borealis, Cystopteris protrusa, Cardamine clematitis, Huperzia lucidula, Rugelia nudicaulis, Streptopus amplexifolius, and <i>Polypodium appalachianum*.

#### OTHER NOTEWORTHY SPECIES

#### CONSERVATION RANK

RANK JUSTIFICATION

This community is scattered throughout the high mountains but fairly uncommon. Unlike many other forest types in the southern Appalachians, this community has not historically been a threatened by logging because of the stunted nature of the trees and the inaccessibility, to loggers, of boulderfields.

DATABASE CODE CEGL006124

G3

## **COMMENTS**

#### Globally

On less extreme sites, generally at lower elevations in the Blue Ridge and adjacent montane ecoregions, a similar boulderfield forest is *Betula alleghaniensis / Acer spicatum / Hydrangea arborescens - Ribes cynosbati / Dryopteris marginalis* Forest (CEGL004982). Similar *Betula alleghaniensis*-dominated forests occur on glaciated rocky slopes in the upper mid-Atlantic and in the northeastern United States. The *Betula alleghaniensis*-dominated periglacial boulderfields of the southern Appalachian Mountains are distinguished from the northern forests by the occurrence of southern Appalachian endemic species, better developed shrub layers, and slightly less species diversity.

## **Great Smoky Mountains National Park**

Examples of this community in the Great Smoky Mountains National Park are compositionally similar to *Betula alleghaniensis / Acer spicatum / Hydrangea arborescens - Ribes cynosbati / Dryopteris marginalis* Forest (CEGL004982). In the Park, this latter community is distinguished by occurring below 5000 feet elevation, having a somewhat more diverse canopy, and by lacking many of the high elevation species such as *Abies fraseri, Dryopteris campyloptera, Ribes glandulosum, Rugelia nudicaulis, Streptopus amplexifolius, Prunus pensylvanica,* and *Sorbus americana*. This community is surrounded by forests dominated by *Picea rubens* and *Betula alleghaniensis*.

#### RANGE

#### **Globally**

This community is found in scattered sites on high elevations of the southern Appalachian Mountains. The majority of this community is distributed within the mountains of North Carolina, but it also occurs in Tennessee and may extend into Georgia and Virginia.

#### Great Smoky Mountains National Park

This association was not observed or sampled on the Mount Le Conte or Cades Cove quadrangles. However, this association is likely within the Park boundary.

#### ENVIRONMENTAL DESCRIPTION

#### **Globally**

This community typically occurs on northerly facing, steep, upper slopes and on the north and northeast side of gaps, at elevations greater than 1370 m (4500 feet) (Whittaker 1956; Crandell 1958). High rainfall and low temperatures create mesic conditions. Strong winds and ice storms periodically damage these forests, creating canopy gaps and contributing to its stunted appearance. This community commonly occurs as small patches surrounded by other forest types.

#### VEGETATION DESCRIPTION

#### Globally

This community is a broad-leaved deciduous forest with a canopy dominated by low-stature, small-stemmed (< 38 cm) Fagus grandifolia, with lesser amounts of Aesculus flava and Betula alleghaniensis. The subcanopy may include small stems of canopy species as well as Acer spicatum, Acer pensylvanicum, Amelanchier laevis, and Sorbus americana. Typically there is little shrub development (2-10 percent) with such species as Crataegus punctata, Ribes spp., Viburnum lantanoides, Rubus canadensis,

Hydrangea arborescens, and Cornus alternifolia. The herbaceous stratum is moderately dense (40-60 percent cover) and is dominated by large herbs and patches of ferns, with lesser amounts of sedges (Bratton 1975; Crandall 1958; Whittaker 1956). Herbaceous species in this community are typical of rich southern Appalachian forests and may include Ageratina altissima var. roanensis, Anemone quinquefolia, Arisaema triphyllum, Aster chlorolepis, Athyrium filix-femina ssp. asplenioides, Carex aestivalis, Carex brunnescens, Carex debilis, Carex intumescens, Carex pensylvanica, Cimicifuga racemosa, Dryopteris campyloptera, Epifagus virginiana, Impatiens pallida, Oxalis montana, Laportea canadensis, Luzula acuminata, Phacelia bipinnatifida, Poa alsodes, Prenanthes altissima, Prenanthes roanensis, Stellaria pubera, Thelypteris noveboracensis, and Trillium erectum.

#### Great Smoky Mountains National Park

No information

#### OTHER NOTEWORTHY SPECIES

Noteworthy plant species that are known to occur in this community include *Lilium grayi*, *Platanthera grandiflora*, *Prenanthes roanensis*, *Stellaria corei*, and *Streptopus roseus* var. *roseus*. Animals found in association with this forest include Bobcat (*Lynx rufus*) and Black Bear (*Ursus americanus*). The exotic European Wild Boar (*Sus scrofa*) has become well-established in the southern Appalachian Mountains and has had negative impacts on the native animals and vegetation in this community.

#### CONSERVATION RANK

G2

#### RANK JUSTIFICATION

This community has a very restricted range with scattered occurrences of small acreage. Many occurrences have been, and continue to be, severely damaged by the European Wild Boar (Sus scrofa). Grazing and soil disturbance by this animal reduces understory herb cover to 10-30 percent of undisturbed levels and may affect tree growth and nutrient cycling (Singer et al. 1984). Beech bark disease, a complex made up of the Beech scale insect (Crytococcus fagisuga) and a closely associated fungus (Nectria coccinea var. faginata) may pose a threat to this community. Another potential threat to this high elevation community is atmospheric deposition of air pollutants, which may result in tree growth decline.

#### DATABASE CODE CEGL006246

#### **COMMENTS**

## Globally

A similar community, *Fagus grandifolia / Carex* spp. Forest, dominated by stunted, gnarled *Fagus grandifolia* with an understory primarily of *Carex* species, occurs on exposed, south-facing slopes above 1370 m (4500 feet) in the southern Appalachian Mountains of North Carolina and Tennessee. The mesic north slope community described here is distinguished from the south slope variant by having a more diverse canopy, a more developed subcanopy, and a less dense (40-60 percent) herbaceous stratum dominated by species other than sedges, although sedges do occur (Crandall 1958; Whittaker 1956). Additionally, *Fagus grandifolia / Ageratina altissima* var. *roanensis* Forest is thought to be more similar to northern hardwood forests (i.e. upper cove forests) and to extend farther into the southwestern Appalachian mountain ranges than does the south slope, sedge-dominated variant, which is thought to be limited to the range of *Picea rubens* and *Abies fraseri* (Whittaker 1958).

#### VEGETATION DESCRIPTION

# Globally

This community is a broad-leaved deciduous forest with a canopy dominated by stunted, gnarled Fagus grandifolia, often with

lesser amounts of *Halesia tetraptera* var. *monticola* or *Betula alleghaniensis*. Typically, there are not significant understory or shrub strata, but scattered shrubs such as *Hydrangea arborescens* may occur. Herbaceous cover is dense, often approaching 100 percent coverage, and dominated by species of *Carex (Carex aestivalis, Carex brunnescens, Carex debilis, Carex intumescens, Carex pensylvanica)*. Ferns and other herbs form 5-20 percent of the herbaceous cover and may include *Ageratina altissima* var. *roanensis, Anemone quinquefolia, Angelica triquinata, Arisaema triphyllum, Aster chlorolepis, Athyrium filix-femina* ssp. *asplenioides, Dryopteris campyloptera, Epifagus virginiana, Erythronium umbilicatum* ssp. *monostolum, Impatiens pallida, Medeola virginiana, Oxalis montana, Laportea canadensis, Luzula acuminata, Phacelia bipinnatifida, Phacelia fimbriata, Poa alsodes, Prenanthes altissima, Prenanthes roanensis, Rugelia nudicaulis, Solidago glomerata, Stellaria corei, Thelypteris noveboracensis*, and *Trillium erectum* (Whittaker 1956; Crandall 1958; Schafale and Weakley 1990).

#### Great Smoky Mountains National Park

This forest has a 10-meter canopy of Fagus grandifolia. The subcanopy is not well-developed, but Acer pensylvanicum has the highest coverage. Other species in the subcanopy include Halesia tetraptera var. monticola, Picea rubens, and Tsuga canadensis. The herbaceous stratum is strongly dominated by Carex pensylvanica (75-85 percent coverage). Other species present in minor amounts include Ageratina altissima var. roanensis, Angelica triquinata, Arisaema triphyllum ssp. triphyllum, Aster chlorolepis, Athyrium filix-femina ssp. asplenioides, Brachyelytrum septentrionale, Dryopteris intermedia, Laportea canadensis, Luzula acuminata, Poa alsodes, Prenanthes sp., Rubus canadensis, Rugelia nudicaulis, Solidago caesia var. curtisii, Stellaria pubera, and Viola rotundifolia.

#### OTHER NOTEWORTHY SPECIES

Species found in this association that are endemic to the southern Blue Ridge or with the bulk of their worldwide distribution there include *Gentiana austromontana*, *Glyceria nubigena*, *Lilium grayi*, *Phacelia fimbriata*, *Platanthera grandiflora*, *Prenanthes roanensis*, *Stellaria corei*, and *Streptopus roseus* var. *roseus*. Animals that are found in association with this forest include Bobcat (*Lynx rufus*) and Black Bear (*Ursus americanus*). The exotic European Wild Boar (*Sus scrofa*) has become well-established in the southern Appalachian Mountains and has had negative impacts on the native animals and vegetation in this community.

#### CONSERVATION RANK G2

#### RANK JUSTIFICATION

Grazing and soil disturbance by this animal reduces understory herb cover to 10-30 percent of undisturbed levels and may affect tree growth and nutrient cycling (Singer et al. 1984). Beech Bark Disease, a complex made up of the Beech scale insect (Crytococcus fagisuga) and a closely associated fungus (Nectria coccinea var. faginata), may pose a threat to this community. Another potential threat to this high elevation community is atmospheric deposition of air pollutants, which may result in tree growth decline.

DATABASE CODE CEGL006130

# **COMMENTS**

#### Globally

This community is often referred to as a classic "beech gap" forest. It includes forest vegetation with short-statured canopies dominated by Fagus grandifolia, occurring over a dense, graminoid-dominated herbaceous stratum. This community is thought to be limited to the range of Picea rubens and Abies fraseri (Whittaker 1958). A similar community, Fagus grandifolia / Ageratina altissima var. roanensis Forest, dominated by short-stature Fagus grandifolia, occurring with Betula alleghaniensis and Aesculus flava, occurs on mesic, north-facing slopes in the southern Appalachian Mountains of North Carolina and Tennessee. This mesic northslope community is thought to be more similar to northern hardwood forests, having a more diverse canopy and subcanopy, and to extend farther into the southwest mountain ranges than does the south slope, sedge-dominated variant described here (Whittaker 1956). Well-developed examples of this type are quite distinct from the Typic Southern Appalachian Northern Hardwoods Forest (Betula alleghaniensis - Fagus grandifolia - Aesculus flava / Viburnum lantanoides / Aster chlorolepis - Dryopteris intermedia Forest – CEGL007285). However, some beech-dominated forests occurring on upper slopes may be transitional between the two types and therefore difficult to classify. Fagus grandifolia / Carex pensylvanica - Carex brunnescens Forest (CEGL006130) may be distinguished by its location in high elevation gaps or ridges, the stature and structure of the gnarled stunted beech trees, the absence of a dense shrub layer, and the predominance of beech in the canopy (Russell 1953).

This community occurs in the southern Appalachians of North Carolina and Tennessee and may range into the Blue Ridge of Georgia and Virginia.

# Great Smoky Mountains National Park

This community was sampled on the Mount Le Conte, Cades Cove, and Kinzel Springs quadrangles. Additional historic samples are from the Calderwood quadrangle (2780 feet elevation). On the Cades Cove quadrangle, historic and recent samples of this community ranged from 2880 to 3960 feet elevation. Samples from the southern portion of the Cades Cove quadrangle came from an east-facing cove of lower Gregory Ridge; protected upper slopes of the Gregory Ridge Trail; lower slopes above Forge Creek; and protected slopes north of Ekaneetlee Gap. In the western portion of the quadrangle, this community was sampled on the northslope of Pine Ridge. In the northern portion of the Cades Cove quadrangle, this community was sampled from a cove above Bunting Branch, north of Coon Butt; from a cove below the north side of Coon Butt; and from upper Fanny Branch. An additional sample of this community was taken from the southern portion of the Kinzel quadrangle, in a cove along Scotts Mountain Trail. Samples from the Mount Le Conte quadrangle ranged from 2508 to 3890 feet elevation. In the central and eastern portion of the Mount Le Conte quadrangle this community was sampled from a cove below Rocky Spur; from broad, protected slopes below Rainbow Falls; west of Porter's Flat on middle cove slopes above Long Branch; and on the west slope above Porter's Creek. In the southwestern portion of the Mount Le Conte quadrangle this community was sampled on a southwest-facing cove above Highway 441 in the vicinity of Fort Harry; on a slope east and south of Balsam Point; from a low Cove above the west Prong of the Pigeon River; on a cove northwest of Bullhead; and on a lowslope/cove above Le Conte Creek, north of Bullhead. Additional examples of this community were found in the western portion of the quadrangle in a cove north of Mt. Winnesoka, and on the north slopes of Piney Mountain, above Cherokee Orchard Road.

## ENVIRONMENTAL DESCRIPTION

#### **Globally**

These forests occur on protected, concave, landforms, at elevation ranging from 2000-4600 feet. Soils that support this vegetation are nutrient-rich and probably high in base saturation and of circumneutral acidity.

# Great Smoky Mountains National Park

This association is found on steep to moderately steep, middle to low protected slopes and coves, on sites with northerly aspects, although it can occur at all aspects. Samples of this community had a mean elevation of 2430 feet, ranging from 2500 to 3960 feet. This community can occur on moist, bouldery situations or over well-developed, but rocky, nutrient-rich soils.

#### **VEGETATION DESCRIPTION**

## Globally

Forests of protected coves in the southern Appalachians, associated with nutrient-rich soils and dominated by Aesculus flava and Acer saccharum, often with Fraxinus americana and/or Tilia americana var. heterophylla sharing dominance. Other canopy species can include Halesia tetraptera var. monticola, Carya cordiformis, and Quercus rubra. A shrub stratum is vary sparse or absent, and the herbaceous stratum is dense and luxurious. Characteristic herbaceous species include Solidago flexicaulis, Hydrophyllum canadense, Hepatica nobilis var. acuta, Deparia acrostichoides, Cystopteris protrusa, Asarum canadense, Carex plantaginea, Cymophyllus fraserianus, and Diplazium pycnocarpon. The herbaceous stratum can have local dominance by Laportea canadensis, Viola canadensis, Dryopteris intermedia, Cimicifuga americana, Cimicifuga racemosa, and Caulophyllum thalictroides.

## Great Smoky Mountains National Park

This forest has a canopy dominated by various combinations of Acer saccharum, Aesculus flava, Tilia americana var. heterophylla, Halesia tetraptera var. monticola, and Fraxinus americana. Occasionally Carva cordiformis or Ouercus rubra may have high coverage in the canopy. The subcanopy is dominated by the canopy species, occasionally with high coverage by Cladrastis kentukea or Ostrva virginiana. The shrub stratum is absent or very sparse, with scattered woody saplings, commonly Acer saccharum, Aesculus flava, and Halesia tetraptera var. monticola. The herbaceous stratum is lush and diverse, with dominance varying among occurrences. Herbaceous species that commonly have high coverage include Adiantum pedatum, Ageratina altissima, Asarum canadense, Aster divaricatus, Caulophyllum thalictroides, Cimicifuga racemosa, Cystopteris protrusa, Deparia acrostichoides, Disporum lanuginosum, Dryopteris intermedia, Dryopteris marginalis, Hydrophyllum canadense, Impatiens pallida, Laportea canadensis, Parthenocissus quinquefolia, Polystichum acrostichoides, Sedum ternatum, Solidago caesia var. curtisii, Solidago flexicaulis, Stellaria pubera, Tiarella cordifolia, and Viola canadensis. Additional species with at least 50 percent constancy include Arisaema triphyllum ssp. triphyllum, Galium triflorum, Hepatica nobilis var. acuta, Osmorhiza claytonii, Polygonatum pubescens, Thalictrum spp. (e.g. Thalictrum clayatum, Thalictrum dioicum, Thalictrum pubescens, Thalictrum thalictroides), Trillium spp. (e.g. Trillium catesbaei, Trillium erectum, Trillium grandiflorum, Trillium rugelii, Trillium undulatum), Uvularia spp. (e.g. Uvularia grandiflora, Uvularia perfoliata), and Monarda spp. (e.g. Monarda clinopodia, Monarda didyma). Aristolochia macrophylla is a common vine. Other species found in this association that are indicative of high-base status soils include *Dryopteris goldiana*, *Sanguinaria canadensis*, and *Panax quinquefolius*.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK G3G4

RANK JUSTIFICATION

DATABASE CODE CEGL007695

#### **COMMENTS**

#### Globally

This association was defined for the richest cove forests in the Great Smoky Mountains and may need revision to apply more generally to similar forests in the southern Blue Ridge. This forest lacks dominance by *Betula alleghaniensis* and *Fagus grandifolia* and has an herbaceous flora indicative of high-base status soils. This association typically has a much more diverse herbaceous stratum than other forests dominated by *Aesculus flava*. Deciduous cove forests are perhaps the most complex group of communities to classify in the southern Blue Ridge, due to a combination of wide environmental range, high species richness,

and high biogeographic variability. The recognition of associations based on fertility and elevation is provisional and will likely need further refinement.

# Great Smoky Mountains National Park

Relative dominance of canopy species varies among examples of this association. Some examples may have canopies strongly dominated by *Halesia tetraptera* var. *monticola*, while others have major canopy dominance by either *Acer saccharum*, *Aesculus flava*, *Tilia americana* var. *heterophylla*, or *Fraxinus americana*. Some examples may have signatures similar to *Aesculus flava* - *Betula alleghaniensis* - *Acer saccharum* / *Acer spicatum* / *Caulophyllum thalictroides* - *Laportea canadensis* Forest (CEGL004973). However, *Aesculus flava* - *Acer saccharum* - (*Fraxinus americana*, *Tilia americana*) / *Hydrophyllum canadense* - *Solidago flexicaulis* Forest (CEGL007695) is distinguished by a characteristic herbaceous flora, by lacking canopy dominance of *Betula alleghaniensis* and *Fagus grandifolia*, and by overall occurring at lower elevations, or on less extreme landforms.

USFWS WETLAND SYSTEM Upland

**RANGE** 

Globally

This association occurs in the southern Blue Ridge of Georgia, North Carolina, Tennessee, and may possibly extend into Virginia.

#### Great Smoky Mountains National Park

This community was sampled on both the Mount Le Conte and Cades Cove quadrangles. Additional historic samples are from the Calderwood (1440 to 1940 feet elevation) and Thunderhead Mountain (2390 to 3420 feet elevation) quadrangles. On the Cades Cove quadrangle, historic and recent samples of this community ranged from 1680 to 3740 feet elevation. Samples from the southern portion of the Cades Cove quadrangle came from the vicinity of Forge Creek in coves along and above the creek, east and north of Gregory Ridge and below Doe Ridge; and from slopes in the lower portion of Gregory Ridge Trail; and on a slope northeast of Birch Springs Gap. In the northeast portion of the quadrangle this community was sampled from a cove at the head of Maynard Creek; a cove above Rowans Creek; a cove along Cork branch, above Rowans Branch; and from a cove below Anthony Ridge. An additional sample of this community was taken from the northwest portion of the Cades Cove quadrangle northeast of Spruce Double on a low slope above Abrams Creek. Only two examples of this community were sampled on the Mount Le Conte quadrangle, and the community is uncommon on this quadrangle. The community was sampled in the central portion of the quadrangle, northwest of Mt. Winnesoka, in a cove near Indian Camp Branch (2935 feet elevation) and in the western portion of the quadrangle, on a steep, low slope above Baskins Creek (1950 feet elevation).

# ENVIRONMENTAL DESCRIPTION

#### Globally

This forest occurs on concave, lower slopes and flats at middle elevations (2000-4500 feet) in the southern Blue Ridge.

# Great Smoky Mountains National Park

This forest was found in low, protected topographic positions, often near small streams, on gentle to moderate slopes with northerly aspects. Samples of this community had a mean elevation of 2500 feet, ranging from 1440 to 3740 feet. Perhaps because of the generally more accessible locations of these forests, many of the sites were logged in the past.

## Great Smoky Mountains National Park

Liriodendron tulipifera, Halesia tetraptera vax. monticola, Carya cordiformis, Fraxinus americana, Tilia americana var. heterophylla, Cimicifuga racemosa, Collinsonia canadensis, Deparia acrostichoides, Disporum lanuginosum, Hepatica nobilis var. acuta, Hydrophyllum canadense, Laportea canadensis, Lindera benzoin, Osmorhiza claytonii, Panax quinquefolius, Polystichum acrostichoides, Thelypteris noveboracensis. Viola canadensis.

#### VEGETATION DESCRIPTION

#### Globally

The canopy is dominated by some mixture of rich site mesophytic species such as *Aesculus flava, Fraxinus americana, Tilia americana* var. *heterophylla*, and *Magnolia acuminata*, occurring with more widely tolerant tree species such as *Liriodendron tulipifera, Acer rubrum, Tsuga canadensis*, and *Betula lenta*. The herbaceous stratum is diverse and often very lush. Typical herbaceous species include *Cimicifuga racemosa, Caulophyllum thalictroides, Disporum lanuginosum, Aruncus dioicus, Adiantum pedatum, Collinsonia canadensis. Osmorhiza claytonii, and Laportea canadensis.* 

### Great Smoky Mountains National Park

The canopy of this forest is dominated by various mixtures of Liriodendron tulipifera, Halesia tetraptera var. monticola, Tilia americana var, heterophylla, Acer rubrum, and Fraxinus americana. Other species that occasionally have high canopy coverage include Acer saccharum, Aesculus flava, Betula lenta, and Tsuga canadensis. If a subcanopy is present it has species from the canopy and often Cornus florida. The shrub stratum is sparse to moderate and is often composed of saplings of canopy species, but composition varies from site to site. Some of the more common shrub species include Acer pensylvanicum, Calycanthus florida, and Rhododendron maximum. The herbaceous stratum has sparse to moderate coverage but is always diverse and contains a mix of species characteristic of high-base status soils occurring with those more typical of acidic forests. Dominance is variable among occurrences and may relate to varying levels of disturbance. Species that most often have moderate to high coverages include Adiantum pedatum, Ageratina altissima, Amphicarpaea bracteata, Aster divaricatus, Carex spp. (e.g. Carex austrocaroliniana, Carex digitalis, Carex laxiflora var. laxiflora, Carex pensylvanica, Carex plantaginea, Carex virescens), Caulophyllum thalictroides, Cimicifuga americana, Collinsonia canadensis, Dryopteris intermedia, Galium triflorum, Laportea canadensis, Maianthemum racemosum ssp. racemosum, Mitchella repens, Osmorhiza claytonii, Polystichum acrostichoides var. acrostichoides, Solidago caesia var. curtisii, Stellaria pubera, Thelypteris noveboracensis, Tiarella cordifolia, and Viola spp. (e.g. Viola blanda, Viola canadensis, Viola cucullata, Viola hastata, Viola pubescens, Viola rotundifolia). Other species commonly found include Arisaema triphyllum, Arisaema triphyllum ssp. triphyllum, Botrychium virginianum, Deparia acrostichoides, Dioscorea quaternata, Disporum lanuginosum, Panax quinquefolius, Parthenocissus quinquefolia, Phegopteris hexagonoptera, Sanguinaria canadensis, Sanicula canadensis, Thalictrum thalictroides, and Uvularia perfoliata. Common vines include Aristolochia macrophylla, Smilax rotundifolia, and Vitis aestivalis. Particularly on disturbed sites, Vitis aestivalis can have high coverage.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK G4

#### RANK JUSTIFICATION

This community is uncommon due to specialized habitat requirements, but it is not rare. It is secure throughout its range, but susceptible to impacts by logging due to its location in accessible topographic positions.

DATABASE CODE CEGL007710

## **COMMENTS**

#### Globally

This association is distinguished by the absence or scarcity of calciphilic species, such as *Diplazium pycnocarpon*, *Asplenium rhizophyllum*, *Dryopteris goldiana*, *Aquilegia canadensis*, *Solidago flexicaulis*, *Deparia acrostichoides*, and *Cystopteris protrusa*, by generally occurring at elevations above 2000 feet and by lacking species typical of lower elevation forests. Deciduous cove forests are perhaps the most complex group of communities to classify in the southern Blue Ridge, due to a combination of wide environmental range, high species richness, and high biogeographic variability. The recognition of associations based on fertility and elevation is provisional and will likely need further refinement.

# Great Smoky Mountains National Park

Some examples described from the Great Smoky Mountains National Park may be more closely related to the global concept of Liriodendron tulipifera - Tilia americana var. heterophylla - (Aesculus flava) / Cimicifuga racemosa Forest (CEGL007291), but

because of the range in elevation (mostly above 2000 feet) and compositional variation among examples, they were placed in *Liriodendron tulipifera - Aesculus flava - (Fraxinus americana, Tilia americana* var. *heterophylla) / Cimicifuga racemosa - Laportea canadensis* Forest (CEGL007710), which has a more general concept. Many examples of this community are disturbed and have canopy coverage of early successional species such as *Liriodendron tulipifera*, *Acer rubrum*, and *Robinia pseudoacacia*, which may tend to make a photosignature similar to *Liriodendron tulipifera - Acer rubrum - Robinia pseudoacacia* Forest (CEGL007219).

# VEGETATION DESCRIPTION

#### **Globally**

This forest is dominated by Liriodendron tulipifera, but other canopy species typically include Tilia americana var. heterophylla, Fraxinus americana, Carya alba, Aesculus flava, Halesia tetraptera, Fagus grandifolia, Quercus alba, and Acer rubrum. Tsuga canadensis is not dominant; shrubs are sparse, if present. In the vicinity of the Chauga River, South Carolina, Acer leucoderme may dominate the understory. Ferns are often locally dominant, typically Thelypteris noveboracensis, Polystichum acrostichoides, Adiantum pedatum, Phegopteris hexagonoptera, and Athyrium filix-femina ssp. asplenioides. The herb stratum is

diverse, and coverage is often scattered. Typical species include Actaea pachypoda, Asarum canadense, Carex plantaginea, Carex austrocaroliniana, Cimicifuga racemosa, Collinsonia canadensis, Goodyera pubescens, Hepatica nobilis var. acuta, Viola blanda, Galium latifolium, Galium circaezans, Trillium catesbaei, Maianthemum racemosum, Sanguinaria canadensis, Thalictrum thalictroides, and Monarda clinopodia. This forest occurs on moderately steep, protected slopes and in coves, over nutrient-rich soils formed from colluvium.

#### COMMENTS

## Globally

This association can have species with Piedmont affinities and lacks species typical of higher elevation cove forests, such as *Acer saccharum, Impatiens pallida, Clintonia umbellulata, Disporum maculatum, Polygonatum pubescens, Streptopus roseus, Astilbe biternata, Veratrum viride*, and *Maianthemum canadense*. This association was originally defined from the Chattooga Basin Project data (S. Simon pers. comm.). Additional examples are known from low escarpment and foothill areas of the southern Blue Ridge, including the Brushy Mountains (Wilkes County, North Carolina), Linville Gorge (Burke County, North Carolina), and the Highland Ranger District, Nantahala National Forest (Jackson and Macon counties, North Carolina). Similar vegetation in the Cumberland Mountains and Plateau is distinguished by the lack of such species as *Carex austrocaroliniana* and *Trillium catesbaei*. Deciduous cove forests are perhaps the most complex group of communities to classify in the southern Blue Ridge, due to a combination of wide environmental range, high species richness, and high biogeographic variability. The recognition of associations based on fertility and elevation is provisional and will likely need further refinement.

## Great Smoky Mountains National Park

Forests similar to this concept found on the Cades Cove quadrangle were classed as *Liriodendron tulipifera - Aesculus flava - (Fraxinus americana, Tilia americana var. heterophylla) / Cimicifuga racemosa - Laportea canadensis* Forest (CEGL007710).

## **RANGE**

### Globally

This association occurs in the southern Appalachian Mountains and Appalachian Plateaus of Georgia, Kentucky, North Carolina, South Carolina, and Tennessee.

#### Great Smoky Mountains National Park

This community was sampled or observed on both the Cades Cove and Mount Le Conte quadrangles and is likely in other areas of the Park. On the Cades Cove quadrangle this community is found on low slopes around Cades Cove; on slopes along lower Green Branch Creek; slopes above Rowans Branch; north of Tater Ridge on low slopes above a creek; on low slopes northwest of Pine Ridge, and in the southeast portion of the quadrangle in the vicinity of Eagle Creek. Areas where it is known to occur on the Mount Le Conte quadrangle include Porter's Flats, in the eastern portion of the quadrangle, and in the northern portion, on low slopes in the watershed of Rhododendron Creek, and a low cove south of Hills Creek. It is likely on other low slopes below 2000 feet elevation in the northern half of the Mount Le Conte quadrangle, particularly in areas that were once settled by humans

# ENVIRONMENTAL DESCRIPTION

#### Globally

This vegetation occurs in areas that have been cleared, clearcut, old fields, or areas cleared by fire or other natural disturbances. It occurs on middle to lower slopes, in sheltered coves and gentle concave slopes, along streams in flat bottoms and on upland mountain benches. It is associated with various soils and geologies. In the southern Appalachians these forests typically occur below 3000 feet and are usually associated with disturbance on the most productive sites. These forests typically occur as small (8-16 hectare) patches in the landscape.

# Great Smoky Mountains National Park

This forest is found on low slopes and flats, typically below 3000 feet elevation and particularly in areas of heavy settlement or past logging or farming activities.

GW

#### Great Smoky Mountains National Park

Liriodendron tulipifera, Acer rubrum, Robinia pseudoacacia, Toxicodendron radicans ssp. radicans, Vitis aestivalis

#### VEGETATION DESCRIPTION

### **Globally**

This vegetation consists of primarily early successional species, with the majority of regeneration from root and stump sprouts. Canopies are typically dominated by *Liriodendron tulipifera* and *Acer rubrum*, with lesser amounts of *Robinia pseudoacacia*. Associated species vary, but these forests are typical of areas that were once clearcut, old fields, or cleared by fire or other natural disturbances. Tall shrubs (*Rhododendron periclymenoides, Rhododendron calendulaceum, Kalmia latifolia, Calycanthus floridus*) sprout from root stocks and occur as scattered, dense clumps, while shorter shrubs (*Gaylussacia ursina, Rubus* spp., *Vaccinium* spp.) can have dense, continuous cover. Composition of the herbaceous stratum varies with site conditions and may contain field-adapted species tolerant of high light intensities, as well as many shade-tolerant forest herbs.

#### Great Smoky Mountains National Park

This forest has a canopy strongly dominated by Liriodendron tulipifera. Other canopy and subcanopy species include Acer rubrum, Robinia pseudoacacia, Acer saccharum, Halesia tetraptera var. monticola, and Betula lenta. Shrubs can be sparse to moderate in coverage, with composition varying from site to site, but often composed of saplings of canopy species. Tsuga canadensis can be dominant in the shrub stratum. Herbaceous cover can be sparse to moderate, with no clear dominant, although Amphicarpaea bracteata and Thelypteris noveboracensis may be dominant in patches. Vines are common and often abundant. Typical vine species are Aristolochia macrophylla, Parthenocissus quinquefolia, Smilax glauca, Smilax rotundifolia, Toxicodendron radicans ssp. radicans, and Vitis aestivalis.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK

#### RANK JUSTIFICATION

This forest represents early successional vegetation or vegetation resulting from anthropogenic activities and is thus not a conservation priority.

#### **RANGE**

#### **Globally**

This community occurs at low to intermediate elevations in the southern Blue Ridge and in the Blue Ridge/Piedmont transition of Georgia, North Carolina, South Carolina, and Tennessee.

# **Great Smoky Mountains National Park**

This community was sampled from both the Cades Cove and Mount Le Conte quadrangle. Historic samples of this community come from low elevations (1120 to 2600 feet) on the Calderwood quadrangle. On low elevations of the Cades Cove quadrangle this community was sampled north of the Cades Cove Loop Road, in the vicinity of Cave Ridge (low east-facing slope, 1791 feet) and west of Paw Paw Ridge at the head of a southwest-facing cove (2230 feet). In the southern portion of the quadrangle, at higher elevations, this community was sampled on the summits and convex high slopes of High Point; the southwest slopes below Gregory Bald; the southeastern high slopes below Moore Spring Camp; the summit ridge of Brier Lick Gap and the upper slopes south of Brier Lick Gap; the southwest middle slopes south of Doe Knob; the upper south slope of Greer Knob; on Twenty Mile Ridge south of Greer Knob; on the convex slopes north of Ekaneetlee Gap; on a south-facing side ridge of Bill Grill Ridge, south of Devils Tater Patch; and the convex west slopes of Mollies Ridge. This community was sampled from the northern portion of the Mount Le Conte quadrangle, on a low slope and low ridge in the vicinity of Copeland Creek (1590 and 1600 feet) and on a low slope above Dudley Creek (1680 feet).

#### **ENVIRONMENTAL DESCRIPTION**

# Globally

These forests occur in a wide elevation range (2000-4000 feet) in the southern Blue Ridge and in the Blue Ridge/Piedmont transition, on protected sites, typically lower slopes, bottoms, and coves.

#### Great Smoky Mountains National Park

This community was sampled at low elevations (1120 to 2600 feet) in draws and on low to middle slopes with south and east aspects. At higher elevations (3800 to 4500 feet) this community occurred on middle to high slopes and summits, with north, west, and south aspects. This forest occurs on sites with well-developed soils.

#### Great Smoky Mountains National Park

Quercus alba, Carya alba, Carya glabra, Cornus florida, Rhododendron calendulaceum

#### VEGETATION DESCRIPTION

#### **Globally**

Deciduous forests of the southern Blue Ridge dominated or codominated by Quercus alba, occurring with other Quercus species (Ouercus rubra, Ouercus prinus, Ouercus coccinea). Associated species are characteristically montane and typical of acidic forests. This association lacks indicators of circumneutral soils and also lacks low elevation dry sites species such as *Pinus* echinata, Quercus falcata, Quercus stellata, and Quercus marilandica. Species other than oaks that can be important in the canopy include Carya alba, Carya glabra, Liriodendron tulipifera, Acer rubrum, and Magnolia fraseri. Common species in the subcanopy/sapling strata include Cornus florida, Acer rubrum, Carya spp., Liriodendron tulipifera, Magnolia fraseri, Nyssa sylvatica, Oxydendrum arboreum, Pinus strobus, and Halesia tetraptera. Shrub cover is sparse to very dense and is often dominated by deciduous heaths. Kalmia latifolia and Gaylussacia ursina are usually present, but other shrub species can include Euonymus americanus, Rhododendron calendulaceum, Vaccinium stamineum, Vaccinium pallidum, Viburnum acerifolium, Calycanthus floridus, Pyrularia pubera, Ilex montana, Halesia tetraptera, and Hamamelis virginiana. Smilax glauca and Vitis rotundifolia are common vines. The herbaceous stratum is sparse to moderate in coverage but rich in species, approaching that of rich cove forests. Associated herbaceous species vary with elevation. Some of the more constant species include Parthenocissus quinquefolia, Dioscorea quaternata, Dichanthelium spp., Carex pennsylvanica, Chimaphila maculata, Desmodium nudiflorum, Goodvera pubescens, Maianthemum racemosum ssp. racemosum, and Trillium catesbaei. Other species include Dichanthelium laxiflorum, Aster acuminatus, Aster divaricatus, Galax urceolata, Galium latifolium, Lysimachia quadrifolia, Mitchella repens, Viola hastata and Melanthium parviflorum. Often there is a dominant fern stratum, with Thelypteris noveboracensis and Polystichum acrostichoides most typically dominant. Other ferns include Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula, and Dryopteris intermedia.

### Great Smoky Mountains National Park

The canopy and subcanopy of this forest are dominated by *Ouercus alba, Carva glabra*, and *Acer rubrum*. At low elevations (below 2600 feet), Carva alba shares canopy dominance, and at high elevations (greater than 3800 feet) Quercus rubra often codominates. Occasionally Ouercus falcata, Liriodendron tulipifera, and Halesia tetraptera var. monticola may have high coverage in the canopy and subcanopy. Other typical species in the canopy and subcanopy include Cornus florida, Nyssa sylvatica, Oxydendrum arboreum, Amelanchier laevis, Quercus prinus, and Quercus velutina. The shrub stratum has sparse to moderate coverage often with no clear dominant. Common shrubs include Acer pensylvanicum, Castanea dentata, Gaylussacia ursina, Ilex opaca, Magnolia fraseri, Robinia pseudoacacia, and Sassafras albidum. Herbaceous cover can be moderately dense and diverse with no clear dominant. Of the plots sampled Amphicarpaea bracteata, Dennstaedtia punctilobula, Desmodium nudiflorum, Polystichum acrostichoides var. acrostichoides, and Thelypteris noveboracensis most often have the highest coverage. Species with the greatest constancy include Ageratina altissima (var. altissima and var. roanensis), Aster divaricatus, Carex spp. (e.g. Carex laxiflora var. laxiflora, Carex pensylvanica, Carex virescens), Chimaphila maculata, Collinsonia canadensis, Dichanthelium spp. (e.g. Dichanthelium boscii, Dichanthelium commutatum, Dichanthelium dichotomum), Dioscorea quaternata, Galium spp. (e.g. Galium circaezans, Galium latifolium, Galium triflorum), Goodvera pubescens, Houstonia purpurea var. purpurea, Lysimachia quadrifolia, Maianthemum racemosum ssp. racemosum, Potentilla canadensis, Prenanthes spp., Solidago caesia var. curtisii, Thalictrum spp. (e.g. Thalictrum dioicum, Thalictrum thalictroides), Trillium spp. (e.g. Trillium catesbaei, Trillium undulatum), Uvularia spp. (e.g. Uvularia perfoliata., Uvularia puberula., Uvularia sessilifolia), and Viola spp. (e.g. Viola blanda, Viola canadensis, Viola cucullata, Viola hastata, Viola rotundifolia, Viola sororia, Viola tripartita), although other species may occur. Common vines include Smilax glauca, Smilax rotundifolia, Vitis aestivalis, and Vitis rotundifolia.

OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK G5

RANK JUSTIFICATION

DATABASE CODE CEGL007230

#### **COMMENTS**

## Globally

This association is meant to cover the typical acidic, oak - hickory forests of the southern Blue Ridge Mountains. It has a broad concept, and there is potential for subdividing this type by moisture, elevation, or undergrowth.

## Great Smoky Mountains National Park

The low elevation (below 2000 feet) *Quercus alba*-dominated forests of the pilot quadrangles have some similarities with forests defined in the *Quercus alba* - *Quercus (falcata, stellata)* Forest Alliance but overall are not dry enough to fit the concept of forests in this alliance. It is likely that *Quercus alba*-dominated vegetation in the Park represents a subset of the Global concept of *Quercus alba* - *Quercus (rubra, prinus) / Rhododendron calendulaceum* - *Kalmia latifolia* - (*Gaylussacia ursina*) Forest (CEGL007230). Samples from the Park can be segregated into two distinct groups: *Quercus alba*-dominated forests below 2200 feet, distinguished by high coverage by *Carya alba, Cornus florida, Liriodendron tulipifera,* and *Polystichum acrostichoides* var. *acrostichoides;* and those over 4000 feet elevation that have greater coverage by *Quercus rubra, Amelanchier laevis, Magnolia acuminata, Ilex montana, Rhododendron calendulaceum,* and *Dennstaedtia punctilobula.* These higher elevation examples still have canopies with high coverage by *Quercus alba* and *Carya glabra,* but the overall composition begins to resemble CEGL007300, particularly along the Tennessee / North Carolina state line on the Cades Cove quadrangle where *Quercus rubra* and *Quercus alba* dominance intergrade and may make delineation of this type difficult.

This association includes forests dominated by *Quercus alba*, occurring over circumneutral soils in the southern Blue Ridge. Other species that can be important in the canopy include *Quercus rubra*, *Quercus coccinea*, *Quercus prinus*, *Carya glabra*, and *Carya alba*. On some sites, species more typical of "cove forests," such as *Fraxinus americana* or *Magnolia acuminata*, may form a very minor component. *Oxydendrum arboreum* and *Cornus florida* are common in the subcanopy. Heath species (*Rhododendron maximum* or *Kalmia latifolia*) are absent or very minor in the shrub stratum. On very high-base status soils, *Philadelphus hirsutus* or *Lindera benzoin* may be in the shrub stratum. The herbaceous stratum can be quite diverse and is characterized by mesic herbs and species associated with circumneutral soils, such as, *Podophyllum peltatum*, *Arisaema triphyllum*, *Amphicarpaea bracteata*, *Adiantum pedatum*, *Collinsonia canadensis*, *Asplenium platyneuron*, *Cimicifuga racemosa*, *Caulophyllum thalictroides*, *Sanguinaria canadensis*, *Tradescantia subaspera*, *Euphorbia purpurea*, *Phegopteris hexagonoptera*,

Polystichum acrostichoides, Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula, and Dryopteris intermedia.

#### **RANGE**

#### Globally

This community is found in the southern Blue Ridge Mountains of Georgia, North Carolina, South Carolina, Tennessee, and Virginia.

#### Great Smoky Mountains National Park

This community was sampled on the Cades Cove and Mount Le Conte quadrangles. Historic samples are from the Cades Cove quadrangle and Thunderhead Mountain quadrangles, but the community is likely in other areas of the Park. On the Cades Cove quadrangle, recent and historic samples representing this community come from elevations ranging from 2170 to 3820 feet. In the northern portion of the quadrangle, this community was sampled from the east- and west-facing low slopes and draws of Leadbetter Ridge and on low slopes in the vicinity of Boring Ridge and Rabbit Creek Road. In the central portion of the quadrangle, this community was also sampled on the low slopes north of Doe Ridge; above Forge Knob Branch; above Licklog Branch; and on northeast high slopes and ridges of Gregory Ridge. It was also sampled in the southeastern portion of the quadrangle on a west-facing draw above Eagle Creek. On the Mount Le Conte quadrangle this community was sampled from elevation ranging from 2295 to 3260 feet. In the western portion of the quadrangle it was sampled on the high, northwest slope of Piney Mountain and in the vicinity of the Baskins Creek trail. In the southeast, it was sampled on a low slope north of Porters Mountain, above Porter Creek.

#### ENVIRONMENTAL DESCRIPTION

#### **Globally**

Quercus rubra forests at intermediate elevations (mostly below 3500 feet, ranging from 2000-4000) in the southern Blue Ridge escarpment. These forests occur on mostly north to east, mid to upper, moderately steep slopes of intermediate exposure, over acidic soils.

### Great Smoky Mountains National Park

This forest occurs at intermediate elevations, mostly on northern and western slopes of intermediate to protected exposure. Elevations averaged 2870 feet but ranged from 2170 to 4000 feet.

CHARACTERISTIC SPECIES

Globally

## Great Smoky Mountains National Park

Quercus rubrum, Acer pensylvanicum, Calycanthus floridus, Pyrularia pubera

#### VEGETATION DESCRIPTION

#### **Globally**

The canopy is dominated by Quercus rubra, often with Acer rubrum and/or Liriodendron tulipifera codominating. Other minor canopy species may include Carya alba, Carya glabra, Halesia tetraptera, Quercus prinus, and Magnolia fraseri. The subcanopy and sapling strata include the canopy species as well as Halesia tetraptera, Betula lenta, Tsuga canadensis, Cornus florida, Acer pensylvanicum, and Oxydendrum arboreum. The shrub stratum is typically sparse but may have local dominance by Gaylussacia ursina or Rhododendron maximum. Other typical species in the shrub stratum include Castanea dentata, Calycanthus floridus, Pyrularia pubera, Rhododendron calendulaceum, Vaccinium corymbosum, and Viburnum acerifolium. Herbaceous cover is sparse to moderate but species rich. Ferns can be locally dominant, typically Thelypteris noveboracensis and Athyrium filix-femina ssp. asplenioides. Other typical species include Aster divaricatus, Carex spp. (e.g. Carex aestivalis, Carex debilis, Carex digitalis, Carex laxiflora var. laxiflora, Carex pensylvanica), Chimaphila maculata var. maculata, Desmodium nudiflorum, Dioscorea quaternata, Eupatorium purpureum, Galium latifolium, Galax urceolata, Goodyera pubescens, Houstonia purpurea var. purpurea, Lysimachia quadrifolia, Maianthemum racemosum ssp. racemosum, Medeola virginiana, Polygonatum biflorum, Polystichum acrostichoides, Solidago caesia var. curtisii, and Uvularia puberula.

### Great Smoky Mountains National Park

This canopy is strongly dominated by Quercus rubra and Acer rubrum. Occasionally Liriodendron tulipifera, Quercus prinus, and Robinia pseudoacacia may have high canopy coverage. The subcanopy is dominated by Acer rubrum, Halesia tetraptera var. monticola, and Oxydendrum arboreum. Other species that may be present in the canopy and subcanopy, but have minor coverage, include Carya alba, Cornus florida, Magnolia fraseri, Betula lenta. Shrub coverage is moderate to high and dominated by deciduous species, most often Gaylussacia ursina. Other highly constant species in the shrub stratum include Acer pensylvanicum, Castanea dentata, Calycanthus floridus, Cornus florida, Pyrularia pubera, Halesia tetraptera var. monticola, Magnolia acuminata, Magnolia fraseri, Nyssa sylvatica, Prunus serotina, Rhododendron calendulaceum, Rhododendron maximum, Sassafras albidum, Vaccinium corymbosum, and Viburnum acerifolium. Tsuga canadensis saplings often have moderate coverage in the shrub stratum. Herbaceous cover is sparse to moderate but species rich. Species with the highest coverage and constancy are Galax urceolata and Thelypteris noveboracensis. Other species with high constancy include Aster divaricatus, Carex aestivalis, Carex debilis, Carex digitalis, Carex laxiflora var. laxiflora, Carex pensylvanica), Chimaphila maculata var. maculata, Dioscorea quaternata, Galax urceolata, Goodyera pubescens, Houstonia purpurea var. purpurea, Lysimachia quadrifolia, Medeola virginiana, Polygonatum biflorum, Polystichum acrostichoides, Solidago caesia var. curtisii, Thelypteris noveboracensis, and Uvularia puberula, but other species may occur. Common vines are Smilax rotundifolia, Smilax glauca, and Vitis aestivalis.

## **COMMENTS**

#### Globally

This forest is distinguished from High Elevation Red Oak forests by lack of species such as *Betula alleghaniensis*, *Ilex montana*, *Vaccinium simulatum*, and by lacking abundant *Hamamelis virginiana*, as well as its occurrence at lower elevations. In the southern Blue Ridge escarpment region, these montane oak - hickory forests seem to occupy environments intermediate between more protected forests dominated by *Quercus alba* and drier, more exposed *Quercus prinus* forests. This association was originally defined from the Chattooga Basin Project (S. Simon pers. comm.) and later refined with information from the Great Smoky Mountains. Global name and concept may need revision as more information becomes available. This association may be a subset of the more broadly defined *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - Kalmia latifolia - (Gaylussacia ursina)* Forest (CEGL007230) but is distinguished by the dominance of *Quercus rubra*, its generally protected topographic setting, and the fact that it may represent areas formerly dominated by *Quercus rubra* and *Castanea dentata*.

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### **Globally**

This community is distributed in the central and southern Appalachians, northern Ridge and Valley, and in the Cumberland Mountains. It occurs in Georgia, Kentucky, North Carolina, South Carolina, Tennessee, and Virginia.

#### Great Smoky Mountains National Park

This community was found on both the Mount Le Conte and Cades Cove quadrangles and is widely distributed elsewhere in the Park. On the Cades Cove quadrangle, recent and historic samples representing this community come from elevations ranging from 2240 to 3940 feet, from all areas of the quadrangle. In the northern portion, this community was sampled on the southern slopes of Arbutus Ridge (2240 and 2280 feet); the eastern slopes (3440 feet) and lower northwestern slopes (2840 feet) of Leadbetter Ridge; and north of Leadbetter Ridge on the north slopes above Anthony Creek. In the central portion of the quadrangle, on the low east and west slopes above Forge Creek, west of Mollies Butt (2657 and 2840 feet); the lower and middle west slopes of Doe Ridge (3000 and 3336 feet); northwest slopes below Powell Ridge, the southern upper slopes and ridges in the vicinity of Mollies Ridge and lower slopes west of Mollies Butt (3200 and 2940 feet); on middle slopes at the northern edge of Gregory's Ridge (2700 feet); and on the middle, southern slopes of Big Grill Ridge (3640 feet). In the southeastern part of Cade Cove quadrangle, this community was sampled from the southeast slope of Paw Paw Ridge (2620 feet). On the Mount Le Conte quadrangle, this community was sampled at elevations ranging from 1800 to 3250 feet. In the northern portion of the quadrangle, this community was sampled from low ridges and slopes north and east of Grapeyard Ridge (1800 to 2100 feet). In the western part of the quadrangle, it was sampled on the low west-facing slopes above Cherokee Orchard (2560 to 2720 feet) and the west slopes below Scratch Britches (3250 feet). In the east, this community was sampled on east-facing, low slopes above the Little Pigeon River (1880 feet).

# ENVIRONMENTAL DESCRIPTION

#### **Globally**

This community occurs over shallow, rocky soils, on south- to west-facing slopes and ridgetops.

# Great Smoky Mountains National Park

This community was found on middle to upper convex slopes and ridges with mostly southern and western aspects. Soils can be deep and well-drained or shallow and rocky. This community typically occurs below 3500 feet elevation but was sampled as high at 3880 feet on a dry ridgeline that was once dominated by pine. At least some occurrences of this community are the result of hardwood succession following fire suppression or pine mortality from Southern pine beetle (*Dendroctonus frontalis*).

Quercus prinus, Quercus coccinea, Acer rubrum, Kalmia latifolia, Gaylussacia ursina

#### VEGETATION DESCRIPTION

#### Globally

Forests with canopies strongly dominated by *Quercus prinus* and/or *Quercus coccinea*, with lesser amounts of *Quercus velutina*, *Quercus rubra*, *Oxydendrum arboreum*, *Nyssa sylvatica*, and *Acer rubrum* var. *rubrum*, occurring over a typically dense shrub stratum, dominated by ericaceous species. The shrub layer may vary between evergreen and deciduous dominance. Typical shrub species include *Kalmia latifolia*, *Rhododendron maximum*, *Vaccinium stamineum*, *Vaccinium pallidum*, *Gaylussacia ursina*, *Gaylussacia baccata*, and *Leucothoe recurva*. *Castanea dentata* may occur abundantly as root sprouts. The herb layer is typically sparse and includes subshrubs such as *Epigaea repens* and *Gaultheria procumbens*. Other common species include *Chamaelirium luteum*, *Chimaphila maculata*, *Galax urceolata*, *Magnolia fraseri*, *Sassafras albidum*, *Symplocos tinctoria*, *Smilax rotundifolia*, and *Smilax glauca*.

# Great Smoky Mountains National Park

The canopy of this forest is dominated by *Quercus prinus, Quercus coccinea*, and *Acer rubrum*, occurring either singly or in various combinations. Other species found in the canopy and subcanopy include *Carya glabra, Cornus florida, Nyssa sylvatica, Oxydendrum arboreum, Pinus rigida, Quercus rubra, Quercus velutina*, and *Robinia pseudoacacia*. The dense shrub layer is dominated by the evergreen shrub *Kalmia latifolia* and/or the deciduous shrub *Gaylussacia ursina*. Other common shrubs include *Rhododendron maximum, Castanea dentata, Vaccinium hirsutum, Vaccinium pallidum*, and *Vaccinium stamineum*. Stands with a heavy deciduous shrub layer tend to have greater herb density and diversity, but typically herbs are sparse. Common herbs include *Chimaphila maculata, Epigaea repens, Galax urceolata*, and *Goodyera pubescens*. The vines *Smilax rotundifolia* and *Smilax glauca* are common and abundant.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK G5

RANK JUSTIFICATION

DATABASE CODE CEGL006271

# **COMMENTS**

#### **Globally**

In the Blue Ridge-Piedmont transition, below 2800 feet elevation, where this community is often associated with *Pinus rigida* forests and woodlands, *Quercus falcata* may be a component of the canopy, and the shrub stratum is strongly dominated by *Vaccinium pallidum*. In the Great Smoky Mountains *Acer rubrum* is often dominant or codominant in these forests, presumably on former chestnut sites.

# Great Smoky Mountains National Park

Many examples of this community are on sites formerly dominated by *Pinus rigida* and *Pinus pungens* and may have these species remaining in the canopy and shrub layers. Other examples occur on sites not dry or rocky enough to support *Pinus*-dominated forests. The canopy and shrub dominants of this community can vary greatly from site to site. This variation is most likely related to a combination of past disturbance regimes and site and soil factors. Stands strongly dominated by *Quercus coccinea* also tended to contain *Pinus rigida* and a dense *Kalmia latifolia* shrub layer. Stands lacking a dense *Kalmia latifolia* shrub layer but rather with a dense deciduous shrub layer also tended to contain high coverage of *Carya glabra* and more herbaceous cover. This community grades downslope into more mesic vegetation such as *Tsuga canadensis* streamside forests and submesic oak forests dominated by *Quercus prinus* and *Quercus rubra*. It grades upslope to more xeric *Pinus*-dominated communities.

#### **COMMENTS**

# Globally

This forest lacks the dense ericaceous shrub layer typical of other *Quercus prinus*-dominated forests in the Blue Ridge escarpment region and commonly has diverse herbaceous composition. It is distinguished from similar forests in the Ridge and Valley by lacking *Acer saccharum* and from Piedmont forests by the lack of *Quercus falcata* and *Quercus stellata*, and by the presence of species more typical of the southern Appalachians (*Magnolia fraseri*, *Halesia tetraptera*, and *Castanea dentata*). This association was originally defined from the Chattooga Basin Project (S. Simon pers. comm.) and later refined with information from the Great Smoky Mountains.

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### Globally

This community occurs in the southern Blue Ridge of Georgia, North Carolina, South Carolina, and Tennessee and could range into Virginia.

### Great Smoky Mountains National Park

This association is uncommon and was sampled at only a single location in the northern portion of the Mount Le Conte quadrangle, above Hill Creek. It was observed on the Cades Cove quadrangle in the vicinity of Bunting Branch. It is possible elsewhere in the Park.

#### ENVIRONMENTAL DESCRIPTION

## Globally

This forest is found on moderate to very steep slopes with northerly exposures, typically at elevations greater than 2800 feet. Soils are deep and well-drained, although rock outcroppings may occur.

# Great Smoky Mountains National Park

This association was sampled on a steep, north-facing slope at 1780 feet elevation. It should be sought on steep, upper, north-facing slopes at elevations up to 3500 feet.

#### VEGETATION DESCRIPTION

#### Globally

This forest is dominated by *Quercus prinus*, usually with lesser amounts of *Quercus rubra* and *Acer rubrum*, occurring over a dense, very tall shrub stratum of *Rhododendron maximum* (2-6 meters). In some areas *Rhododendron minus* may dominate or *Tsuga canadensis* may have dense understory regeneration. Other common shrubs include *Gaylussacia ursina* and *Kalmia latifolia*. Herbs are sparse, but *Galax urceolata* is in most occurrences. Some examples may have sparse canopies and occur in association with rock outcroppings.

# Great Smoky Mountains National Park

This forest is dominated by *Quercus prinus*, with lesser amounts of *Acer rubrum*, occurring over a dense, tall-shrub stratum of *Rhododendron maximum*. Groundcover is dominated by leaf litter, and herbs are scattered about. Typical herbs include *Chimaphila maculata, Galax urceolata, Goodyera pubescens*, and *Polystichum acrostichoides*.

#### RANGE

#### **Globally**

This community occurs on most of the major mountain ranges of the southern Appalachians in North Carolina, Tennessee, and Georgia. This community could possibly range into South Carolina, Virginia, and West Virginia.

#### Great Smoky Mountains National Park

This community was sampled from a single location, in the central portion of the Cades Cove quadrangle, on the northeast summit of McCampbell Knob (4400 feet elevation). It was not found on the Mount Le Conte quadrangle but could occur in other areas of the Park.

#### ENVIRONMENTAL DESCRIPTION

#### **Globally**

This community occurs on most of the major mountain ranges of the southern Appalachians at elevations of 1070-1525 m (3500-5000 feet) on ridges and mid to upper slope positions, commonly with south and southeast exposures. DeLapp (1978) found that this community type occurs on most slope aspects but was most commonly found on southeast and south exposures. This community occurs over well-drained soils underlain by Precambrian gneisses, schists, and granites. These soils are classified as Typic, Umbric, or Lithic Dystrochrepts, and Typic Haplumbrepts (Golden 1974). Soils supporting this forest with a mainly evergreen shrub understory are slightly more acidic than *Quercus rubra*-dominated forests with deciduous shrub understories (DeLapp 1978).

# Great Smoky Mountains National Park

This community was sampled on a flat summit at 4400 feet elevation. The canopy had damage by insects.

# Great Smoky Mountains National Park

Quercus rubra, Hamamelis virginiana, Ilex montana, Rhododendron maximum, Galax urceolata

#### VEGETATION DESCRIPTION

## Globally

This montane community includes forest vegetation with *Quercus rubra* making up at least 75 percent of the tree canopy and with greater than 20 percent shrub cover, which may be continuous to patchy. More than 50 percent of the total shrub cover is evergreen, although deciduous shrubs may be present. Typical shrub dominants include *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron maximum*. The herbaceous stratum is not diverse and is typically very sparse with scattered forbs (*Galax urceolata, Solidago caesia* var. *curtisii, Epigaea repens, Dennstaedtia punctilobula, Conopholis americana, Thelypteris noveboracensis, Clintonia umbellulata, Aster divaricatus, Dioscorea villosa).* 

#### Great Smoky Mountains National Park

This community has a rather open canopy dominated by *Quercus rubra*. Other species with minor canopy/subcanopy coverage include *Acer rubrum, Betula alleghaniensis, Hamamelis virginiana, Ilex montana, Oxydendrum arboreum,* and *Prunus serotina*. The tall-shrub stratum is extremely dense and dominated by *Rhododendron maximum*. Other shrubs include *Rubus canadensis, Kalmia latifolia,* and *Leucothoe fontanesiana*. Typical species in the sparse herb stratum are *Dryopteris intermedia, Galax urceolata, Carex pensylvanica,* and *Dennstaedtia punctilobula*.

#### OTHER NOTEWORTHY SPECIES

Animals that use this community include Red Squirrel (*Tamiasciurus hudsonicus*) and Eastern Chipmunk (*Tamias striatus*). Many plant species in this community are endemic to the southern Blue Ridge or have the bulk of their worldwide range in that region, including *Abies fraseri*, *Aesculus flava*, *Ageratina altissima* var. *roanensis*, *Euphorbia purpurea*, *Leucothoe recurva*, *Prenanthes roanensis*, *Rhododendron catawbiense*, *Rhododendron vasevi*, *Silene ovata*, and *Solidago caesia* var. *curtisii*.

CONSERVATION RANK

RANK JUSTIFICATION This community is uncommon but not rare. It is secure within its range.

DATABASE CODE CEGL007299

#### **COMMENTS**

#### Globally

Major compositional variation within this community is related to a moisture gradient, which in turn is a function of topographic position and relative amount of solar radiation received (DeLapp 1978). Occurrences of this community with a shrub understory dominated by *Kalmia latifolia* and/or *Rhododendron catawbiense* are on exposed sites, such as ridgetops or south-facing slopes, with excessively drained, shallow soils. These exposed forests often contain *Quercus prinus, Pinus rigida*, and *Pinus pungens*. Occurrences of this community with a shrub understory dominated by *Rhododendron maximum* are on sites of intermediate exposure, with deeper soils, often with north and east aspects. These less exposed occurrences tend to have taller canopies than those on ridgetops. At higher elevations this forest often occurs adjacent to or grades into forests dominated by *Picea rubens, Abies fraseri*, or northern hardwood species (*Betula alleghaniensis, Fagus grandifolia, Aesculus flava*). Many *Quercus rubra*dominated stands of today were, prior to the Chestnut Blight in the 1930s, dominated or codominated by *Castanea dentata* with scattered *Quercus rubra* and *Acer rubrum* in the canopy (Golden 1974). The fungus *Endothia parasitica* eliminated *Castanea dentata* in the upper canopy, subsequently releasing the subcanopy *Quercus rubra*, which eventually resulted in a nearly pure upper canopy of large *Quercus rubra*.

# Great Smoky Mountains National Park

This forest occurs adjacent to north slope forests dominated *Betula alleghaniensis* and *Fagus grandifolia*. It is unlikely that the signature of this community can be distinguished from other forests in this alliance.

CLASSIFICATION CONFIDENCE LEVEL 1

USFWS WETLAND SYSTEM Upland

#### **RANGE**

#### **Globally**

This community occurs on most of the major mountain ranges of the southern Appalachians in North Carolina, Tennessee, and Georgia. It may possibly range into Kentucky's Cumberland Mountains and into Virginia and West Virginia.

# **Great Smoky Mountains National Park**

This community was sampled on the Cades Cove quadrangle and was not found on the Mount Le Conte quadrangle. Historic samples are from the Cades Cove quadrangle and the Thunderhead Mountain quadrangle, but the community is likely in other areas of the Park. On the Cades Cove quadrangle, recent and historic samples representing this community come from elevations ranging from just over 4000 feet to 5000 feet, in the southern portion of the quadrangle. This community was sampled from the summits and convex high slopes Gregory Ridge; the southwest slopes below Gregory Bald; the southeastern high slopes below Moore Spring Camp; the western summit of Pond Knob; and the convex west slopes of Mollies Ridge.

#### ENVIRONMENTAL DESCRIPTION

### Globally

This community occurs at elevations of 1070-1525 m (3500-5000 feet) on broad ridges and mid to upper slope positions. DeLapp (1978) found that this community occurs on most slope aspects but was most commonly found on southeast and south exposures. This community occurs over well-drained soils underlain by Precambrian gneisses, schists, and granites. These soils are classified as Typic, Umbric, or Lithic Dystrochrepts, and Typic Haplumbrepts (Golden 1974). Soils supporting this forest with a mainly deciduous shrub understory are slightly less acidic than *Quercus rubra*-dominated forests with evergreen shrub understories (DeLapp 1978). Occurrences of this community on exposed slopes and south- and west-facing ridges are subject to lightening-caused fires and damage by ice and wind. Damage by ice storms is probably the most common form of natural disturbance.

# Great Smoky Mountains National Park

This community was sampled at elevations from 4000 to 5000 feet, on high slopes, ridges, and summits with northern to southwestern aspects. Most examples showed evidence of disturbance by wind, ice, and Chestnut Blight.

See above

## VEGETATION DESCRIPTION

#### Globally

This forest is dominated by *Quercus rubra* with other species making up less than 25 percent of the canopy cover. Other canopy and subcanopy trees may include *Acer rubrum, Betula alleghaniensis, Betula lenta, Castanea dentata* (root sprouts), *Hamamelis virginiana, Fagus grandifolia, Ilex montana, Acer pensylvanicum, Halesia tetraptera,* and on more exposed sites, *Quercus prinus*. At higher elevations, this community may contain *Picea rubens*. The shrub layer may be continuous to patchy but has at least 20 percent cover and more than 50 percent of the total shrub cover is deciduous, although evergreen shrubs may be present. Typical shrub dominants include *Rhododendron calendulaceum, Vaccinium simulatum, Vaccinium erythrocarpum, Ilex montana, Gaylussacia ursina, Rubus canadensis, Corylus cornuta, and Lyonia ligustrina*. Other shrubs occur with low frequency and may include *Kalmia latifolia, Rhododendron catawbiense, Rhododendron maximum. Rubus allegheniensis* occurs in disturbed openings and in seeps. The herbaceous stratum is diverse and is predominantly a mix of sedges, ferns, and tall herbs. Herbaceous dominance varies within and between occurrences. Typical herbaceous species include *Ageratina altissima* var. *roanensis, Aster divaricatus, Aster acuminatus, Athyrium filix-femina* ssp. *asplenioides, Clintonia umbellulata, Collinsonia canadensis, Conopholis americana, Dennstaedtia punctilobula, Dioscorea villosa, Laportea canadensis, Lysimachia quadrifolia, Medeola virginiana, Monarda fistulosa, Potentilla canadensis, Prenanthes roanensis, Silene stellata, Solidago caesia* var. *curtisii,* and *Thelypteris noveboracensis*.

#### Great Smoky Mountains National Park

The canopy of this forest is strongly dominated by *Quercus rubra*, often gnarled and stunted, particularly on sites affected by wind and ice. Other minor canopy trees include *Quercus alba* and *Acer rubrum*. The subcanopy can be absent or have moderate coverage and commonly includes *Acer rubrum* and *Amelanchier laevis*. The shrub strata are moderate to dense and dominated by deciduous species, commonly *Ilex montana*, *Rhododendron calendulaceum*, *Castanea dentata*, *Rubus canadensis*, *Vaccinium erythrocarpum*, and *Vaccinium corymbosum*. The well-developed herbaceous stratum is quite diverse and can approach 100 percent coverage. Fern species (*Dennstaedtia punctilobula*, *Thelypteris noveboracensis*) are often dominant, but many other species can occur. Some of the other herbaceous species found in this forest include *Ageratina altissima* var. *roanensis*, *Agrostis perennans*, *Agrostis stolonifera*, *Aster divaricatus*, *Aster macrophyllus*, *Carex pensylvanica*, *Clintonia umbellulata*, *Collinsonia canadensis*, *Dichanthelium* spp., *Dioscorea quaternata*, *Eupatorium maculatum*, *Galium latifolium*, *Gentianella quinquefolia* ssp. *quinquefolia*, *Hieracium paniculatum*, *Houstonia purpurea* var. *purpurea*, *Houstonia serpyllifolia*, *Lysimachia quadrifolia*, *Maianthemum racemosum*, *Medeola virginiana*, *Monarda clinopodia*, *Prenanthes* spp., *Silene stellata*, *Smilax herbacea*, *Solidago caesia* var. *curtisii*, and *Stenanthium gramineum*.

# OTHER NOTEWORTHY SPECIES

Animals that use this community include Red Squirrel (*Tamiasciurus hudsonicus*) and Eastern Chipmunk (*Tamias striatus*). Many species in this community are endemic to the southern Blue Ridge or have the bulk of their worldwide range in that region. Some of these endemics include *Abies fraseri*, *Aesculus flava*, *Ageratina altissima* var. *roanensis*, *Carex roanensis*, *Clethra acuminata*, *Euphorbia purpurea*, *Leucothoe recurva*, *Prenanthes roanensis*, *Rhododendron catawbiense*, *Rhododendron vaseyi*, *Silene ovata*, *Solidago caesia* var. *curtisii*, and *Vaccinium erythrocarpum*.

CONSERVATION RANK G4

RANK JUSTIFICATION This community is uncommon but not rare. It is secure within its range.

DATABASE CODE CEGL007300

#### **COMMENTS**

#### **Globally**

Major compositional variation within this community is related to a moisture gradient, which in turn is a function of topographic position and relative amount of solar radiation received (DeLapp 1978). Occurrences on open slopes with deeper soils may have understories dominated by clones of *Corylus cornuta*. Density of the shrub layer and the importance of herbs in the understory vary among occurrences. Many *Ouercus rubra*-dominated stands of today were, prior to the Chestnut Blight in the 1930s,

dominated or codominated by *Castanea dentata* with scattered *Quercus rubra* and *Acer rubrum* in the canopy (Golden 1974). The fungus *Endothia parasitica* eliminated *Castanea dentata* in the upper canopy, subsequently releasing the subcanopy *Quercus rubra*, which eventually resulted in a nearly pure upper canopy of large *Quercus rubra*. At higher elevations this forest often occurs adjacent to or grades into forests dominated by *Picea rubens*, *Abies fraseri*, or northern hardwood species (*Betula alleghaniensis*, *Fagus grandifolia*, *Aesculus flava*). In some areas, this community is found adjacent to montane shrublands and grasslands. At low elevations on dry sites, this community may grade into forests dominated by mixed *Quercus* species.

### Great Smoky Mountains National Park

Particularly along the Tennessee / North Carolina state line on the Cades Cove quadrangle, *Quercus rubra* and *Quercus alba* dominance intergrades and may make delineation of this type difficult. Lower elevation occurrences (below 4500 feet elevation) begin to resemble Typic Acidic Montane Oak – Hickory Forest (*Quercus alba - Quercus (rubra, prinus)* / *Rhododendron calendulaceum - Kalmia latifolia - (Gaylussacia ursina*) Forest, CEGL007230) in composition, with an increase in coverage of species such as *Acer rubrum, Quercus alba, Cornus florida, Magnolia fraseri, Oxydendrum arboreum, Robinia pseudoacacia, Carya* spp., *Gaylussacia ursina*, and *Vaccinium hirsutum*, and the presence of herbs more indicative of lower elevation forests. It is unlikely that the signature of this community can be distinguished from other forests in the *Quercus rubra* Montane Forest Alliance.

## VEGETATION DESCRIPTION

## Globally

This community includes forest vegetation, with a closed to very open canopy, where *Quercus rubra* makes up at least 75 percent of the tree canopy and with less than 20 percent shrub cover. Canopy trees may be gnarled and stunted, especially on ridge crests. Other canopy species may include *Acer rubrum*, *Crataegus punctata*, *Crataegus flabellata*, *Betula alleghaniensis*, *Betula lenta*, and, at high elevations, *Picea rubens*. An open subcanopy contains canopy species plus *Hamamelis virginiana*, *Amelanchier arborea*, *Acer pensylvanicum*, *Halesia tetraptera*, and *Ilex montana*. Herbaceous cover is dense and diverse, composed of sedges, ferns, and tall herbs, with dominance varying within and between occurrences. Typical herbaceous dominants include *Carex pensylvanica*, *Ageratina altissima* var. *roanensis*, *Thelypteris noveboracensis*, *Dennstaedtia punctilobula*, *Aster chlorolepis*, *Aster acuminatus*, and *Laportea canadensis*.

## Great Smoky Mountains National Park

The canopy of this short-stature forest is strongly dominated by *Quercus rubra*. Other trees that may form a minor portion of the canopy and subcanopy include *Acer rubrum*, *Halesia tetraptera* var. *monticola*, and *Prunus serotina*. The shrub stratum is open with scattered shrubs, mostly *Halesia tetraptera* var. *monticola* and *Ilex montana*. Other species in the shrub stratum include *Acer pensylvanicum*, *Acer saccharum*, *Kalmia latifolia*, *Magnolia fraseri*, *Prunus serotina*, *Rubus canadensis*, *Vaccinium corymbosum*, and *Vaccinium erythrocarpum*. The herbaceous stratum is strongly dominated by *Carex pensylvanica*, which forms a dense carpet. Other herbaceous species include *Angelica triquinata*, *Aster chlorolepis*, *Clintonia umbellulata*, *Cuscuta rostrata*, *Dioscorea quaternata*, *Dryopteris intermedia*, *Gentianella quinquefolia* ssp. *quinquefolia*, *Lilium superbum*, *Maianthemum racemosum*, *Medeola virginiana*, *Mitchella repens*, *Prenanthes altissima*, *Smilax herbacea*, *Solidago caesia* var. *curtisii*, and *Thelypteris noveboracensis*.

## OTHER NOTEWORTHY SPECIES

Animals that use this community include Red Squirrel (*Tamiasciurus hudsonicus*) and Eastern Chipmunk (*Tamias striatus*). Many species in this community are endemic to the southern Blue Ridge or have the bulk of their worldwide range in that region. Some of these endemics include *Abies fraseri*, *Aesculus flava*, *Ageratina altissima* var. *roanensis*, *Carex roanensis*, *Clethra acuminata*, *Euphorbia purpurea*, *Leucothoe recurva*, *Prenanthes roanensis*, *Rhododendron catawbiense*, *Rhododendron vaseyi*, *Silene ovata*, *Solidago caesia* var. *curtisii* and *Vaccinium erythrocarpum*.

### CONSERVATION RANK

## RANK JUSTIFICATION

This community is relatively secure within its range but has a naturally restricted habitat. Red oak decline is affecting occurrences of this community; fire may be needed for stand establishment.

DATABASE CODE CEGL007298

G2

## **COMMENTS**

## Globally

This community occurs as smaller stands (30-100 acres) and is less common than other forests in this alliance. It often occurs adjacent to or grades into forests dominated by *Picea rubens, Abies fraseri*, or northern hardwood species (*Betula alleghaniensis, Fagus grandifolia, Aesculus flava*). In some areas, this community is found adjacent to montane shrublands and grasslands. This community is often referred to as a "Subalpine Oak Orchard Forest." Many *Quercus rubra*-dominated stands of today were, prior to the Chestnut Blight in the 1930s, dominated or codominated by *Castanea dentata* with scattered *Quercus rubra and Acer rubrum* in the canopy (Golden 1974). The fungus *Endothia parasitica* eliminated *Castanea dentata* in the upper canopy, subsequently releasing the subcanopy *Quercus rubra*, which eventually resulted in a nearly pure upper canopy of large *Quercus rubra*.

## Great Smoky Mountains National Park

While the single sample of this community seems to represent the assigned association, the vegetation on the overall ridgeline may be more appropriately mapped as *Quercus rubra / (Vaccinium simulatum, Rhododendron calendulaceum) / (Dennstaedtia punctilobula, Thelypteris noveboracensis)* Forest (CEGL007300) or even as *Quercus rubra* Montane Forest Alliance, as it is unlikely that the various associations in this alliance will have distinguishable signatures.

## Great Smoky Mountains National Park

Sweetgum-dominated alluvial forests were sampled from both the Cades Cove and Mount Le Conte quadrangles and are likely in other areas of the Park. They were sampled from the northern portion of the Mount Le Conte quadrangle, on the floodplain of the Little Pigeon River, northeast of the Greenbrier Campground and also near the confluence with Ted's Branch; on the Lower Little Pigeon River, near the northern Park boundary; and on the broad floodplain of Dud's Branch, near Dudley Creek. On the Cades Cove quadrangle this community was sampled in the northern half of the quadrangle, off the Cades Cove Loop Road, in the vicinity of Mills Creek and Abrams Creek and along Rowans Branch; and just south of the Loop Road, in the vicinity of Mill Creek Road.

## ENVIRONMENTAL DESCRIPTION

### Globally

No information

## Great Smoky Mountains National Park

This forest is found on large alluvial flats and high terraces along large rivers (*e.g.* Little Pigeon River) or on small, disturbed flats along medium-sized perennial streams. This community often occurs on sites that were formerly cleared for farming or settlement. Soils are typically deep, loamy silts but can have large rocks and cobbles. The mean elevation of samples is 1680 feet, ranging from 1480 to 1900 feet.

VEGETATION DESCRIPTION *Globally*No information

## Great Smoky Mountains National Park

This forest has an open to closed canopy dominated by Liquidambar styraciflua and Liriodendron tulipifera, often with Platanus occidentalis. Other minor species that are variably present in the canopy include Acer rubrum, Fraxinus americana, Juglans nigra, Pinus virginiana, Prunus serotina, Robinia pseudoacacia, Tilia americana var. heterophylla, and Ulmus americana. The subcanopy is absent to well-developed. Typical dominants are Carpinus caroliniana, Cornus florida, and Acer rubrum. Other species that can be present in the subcanopy include Betula alleghaniensis, Betula lenta, Tsuga canadensis, Juglans cinerea, Halesia tetraptera var. monticola, Acer pensylvanicum, Acer saccharum, Amelanchier laevis, Oxydendrum arboreum, and Prunus serotina. The shrub stratum is absent to moderately dense. Rhododendron maximum and Tsuga canadensis are the most common shrubs, although other species can be present. Herbaceous cover is often absent or sparse, with groundcover dominated by litter and duff. On smaller streams, near open fileds or where animal grazing is evident, herbaceous cover can approach 100 percent cover. Species often present with high coverage include Amphicarpaea bracteata, Dichanthelium boscii, Microstegium vimineum, Thelypteris noveboracensis, and Toxicodendron radicans ssp. radicans. Other common species include Arisaema triphyllum, Asplenium platyneuron, Aster divaricatus, Cares spp. (e.g. Carex digitalis, Carex intumescens, Carex laxiflora var. laxiflora, Carex plantaginea, Carex platyphylla, Carex retroflexa, Carex swanii, Carex torta), Dichanthelium spp, (e.g. Dichanthelium commutatum, Dichanthelium dichotomum, Dichanthelium sphaerocarpon), Houstonia serpyllifolia, Laportea canadensis, Mitchella repens, Parthenocissus quinquefolia, Polystichum acrostichoides, Prenanthes spp., Sanicula canadensis, and Verbesina alternifolia.

DATABASE CODE CEGL007880

## COMMENTS

## **Globally**

This association was defined from disturbed floodplains in the Great Smoky Mountains National Park and may represent a subset of the more broadly defined *Platanus occidentalis - Liriodendron tulipifera - Betula (alleghaniensis, lenta) / Alnus serrulata - Leucothoe fontanesiana* Forest (CEGL004691), Montane Alluvial Forest (Large River Type). However, natural forests strongly dominated by *Liquidambar styraciflua* are uncommon in southern Blue Ridge landscapes, thus this forest may represent a community that is more common west of the Blue Ridge, in the Ridge and Valley. Information from a larger geographic range is needed to distinguish this association. A similar alliance is the *Liquidambar styraciflua - (Liriodendron tulipifera, Acer rubrum)* Temporarily Flooded Forest Alliance, but it is currently not defined for the southern Blue Ridge.

## Great Smoky Mountains National Park

Given the taxonomic uncertainty of this association, consideration should be given to mapping this vegetation at the Alliance level.

## CHARACTERISTIC SPECIES

## Globally

Platanus occidentalis, Liriodendron tulipifera, Liquidambar styraciflua, Betula alleghaniensis, Betula lenta, Carpinus caroliniana, Betula nigra, Fraxinus americana, Tsuga canadensis, Leucothoe fontanesiana, Rhododendron maximum, Alnus serrulata, Xanthorhiza simplicissima

## Great Smoky Mountains National Park

No information

## VEGETATION DESCRIPTION

## Globally

Canopy composition is variable but typical dominants are *Platanus occidentalis*, *Liriodendron tulipifera*, *Liquidambar styraciflua*, *Betula alleghaniensis*, and *Betula lenta*. Other canopy/subcanopy trees can include *Carpinus caroliniana*, *Hamamelis virginiana*, *Betula nigra*, *Fraxinus americana*, *Acer rubrum*, *Pinus virginiana*, *Pinus strobus*, and *Tsuga canadensis*. Vines can be prominent, including *Aristolochia macrophylla*, *Parthenocissus quinquefolia*, *Smilax glauca*, *Smilax rotundifolia*, and *Vitis aestivalis*. The shrub stratum can be dense, often with local dominance by *Leucothoe fontanesiana* or *Rhododendron maximum*. Other characteristic shrubs include *Alnus serrulata*, *Xanthorhiza simplicissima*, and *Hydrangea arborescens*. Herbaceous species composition varies from site to site, and herbaceous strata can be quite patchy on the rocky substrate.

Characteristic species known from these forests include *Amphicarpaea bracteata*, *Cimicifuga racemosa*, *Polystichum acrostichoides*, *Aster divaricatus*, and *Viola blanda*. *Carex* species may be common (e.g. Carex appalachica, Carex austrocaroliniana, Carex blanda, Carex digitalis, Carex plantaginea, Carex swanii, Carex torta).

## RANGE

Globally

This forest occurs in the low mountains of Georgia, North Carolina, South Carolina, and Tennessee, and could possibly range into Virginia.

### Great Smoky Mountains National Park

This community was sampled on the Cades Cove quadrangle but was not found on the Mount Le Conte quadrangle. It is likely in other areas of the Park. On the Cades Cove quadrangle, it was sampled or observed north of the Cades Cove Loop Road, along the ridgeline of Tater Ridge (2500 feet); on the steep north-facing slopes off Crooked Arm Ridge (2400 feet); and on the north-facing slopes above Laurel Creek (2100 feet). It was also sampled southwest of the Cades Cove Loop Road, on low ridges (2000 feet) north and south of Abrams Creek, and on gentle, southwest slopes, east of Forge Creek Road (2000 feet).

## ENVIRONMENTAL DESCRIPTION

## Globally

This community occurs on exposed upper slopes and ridgetops at elevations below 920 m (3000 feet) in the southern Appalachian Mountains.

### Great Smoky Mountains National Park

This community was found mostly below 2000 feet elevation (ranging from 1560 to 2400 feet) convex slopes and low ridges. Many stands showed evidence of past logging, and most examples are in early to middle stages of succession.

## VEGETATION DESCRIPTION

## Globally

Forest vegetation with *Pinus strobus* contributing 25-75 percent of the canopy coverage and with *Quercus prinus* and *Quercus coccinea* occurring singly or in combination as 25-75 percent of the canopy coverage. Open subcanopies are composed of *Oxydendrum arboreum, Acer rubrum* var. *rubrum, Nyssa sylvatica*, and *Cornus florida*. The shrub stratum is dominated by deciduous heath species, typically *Gaylussacia ursina* or *Vaccinium stamineum*. Other species in the shrub/sapling stratum may include *Vaccinium pallidum, Leucothoe recurva, Kalmia latifolia, Castanea dentata*, or *Acer rubrum* var. *rubrum*. On rocky sites, *Deschampsia flexuosa* may be common.

## Great Smoky Mountains National Park

Forests with a well-developed canopy and subcanopy dominated by *Pinus strobus*, codominating with *Quercus prinus* and *Acer rubrum*. Other species that can have high coverage in the canopy or subcanopy include *Quercus coccinea*, *Pinus rigida*, *Nyssa sylvatica*, *Oxydendrum arboreum*, and *Pinus virginiana*. Other trees the can be present include *Pinus echinata*, *Quercus alba*, *Quercus rubra*, *Amelanchier laevis*, *Carya glabra*, and *Tsuga canadensis*. The tall-shrub stratum can be moderately to very dense and is typically dominated by *Kalmia latifolia*, *Acer rubrum*, or *Rhododendron maximum*. The short-shrub stratum is dense and dominated by *Gaylussacia ursina* or *Vaccinium pallidum*. Other species that can be in the shrub strata include saplings of canopy and subcanopy species and *Vaccinium hirsutum*, *Vaccinium stamineum*, *Calycanthus floridus*, *Castanea dentata*, *Cornus florida*, *Ilex opaca*, *Magnolia fraseri*, *Pyrularia pubera*, *Robinia pseudoacacia*, and *Sassafras albidum*. The shrub stratum is sparse, and the ground is often dominated by leaf litter. Typical herb species include *Chimaphila maculata*, *Dioscorea quaternata*, *Epigaea repens*, *Galax urceolata*, *Gaultheria procumbens*, *Goodyera pubescens*, *Lysimachia quadrifolia*, *Pteridium aquilinum*, *Uvularia puberula*, and *Viola hastata*. *Smilax rotundifolia* and *Smilax glauca* are common vines.

RANGE

Globally

This community is known from the Blue Ridge in western North Carolina and eastern Tennessee and may range into South Carolina.

## Great Smoky Mountains National Park

This community was not sampled, nor is it likely, on the Mount Le Conte or Cades Cove quadrangles. It is an uncommon community but may occur in the Park where shale outcrops occur on steep slopes. One occurrence is known from the Calderwood quadrangle, on Chilhowhee Mountain.

### ENVIRONMENTAL DESCRIPTION

### Globally

This community is known to occur over somewhat calcareous shales in the Hot Springs Window, in the Blue Ridge of North Carolina and Tennessee. It is apparently a long-lived community, maintained by harsh edaphic conditions of steep slopes and shifting shale substrate.

### **RANGE**

## Globally

This association was described from high elevations in the Great Smoky Mountains National Park and needs further regional and national assessment. It is likely that is also occurs in the high mountain areas of western North Carolina.

## Great Smoky Mountains National Park

This community was sampled only on the Mount Le Conte quadrangle but is possible on the Cades Cove quadrangle, and certainly in other areas of the Park. On the Mount Le Conte quadrangle, samples of this ranged from 3400 to 4400 feet elevation and was found on lower slopes on the northern flanks of Mount Le Conte, the steep south-facing slopes southwest of Balsam Point, as well as on the north-facing slopes above the West Prong of the Pigeon River and its tributaries, Walker Camp Prong and Trout Branch, and the steep slopes above and lower slopes and flats along Alum Cave Creek. [This community made up all or part of the photointerpreter's polygons 28, 30, 33, 34, and 35 on the Mount Le Conte quadrangle.] An historic sample from the southwestern portion of the Cades Cove quadrangle, at 3800 feet, at the head of a cove east of High Point, may represent this community.

### ENVIRONMENTAL DESCRIPTION

## Globally

No information

## Great Smoky Mountains National Park

This community was found on steep, mostly north-facing slopes, and on slopes and flats along and above streams. These forests occur on middle slope or toe slope positions, protected by higher landforms. The elevations of samples ranged from as low as 3400 feet elevation to around 4400 feet, but the community can probably occur as high as 5000 feet or until *Picea rubens* begins to dominate. Sites are rocky, often with many large boulders and talus. Soils are stony with heavy litter layers. These forests are affected by occasional disturbance by ice, wind, and landslides.

### Great Smoky Mountains National Park

This mixed forest type has an open to closed canopy dominated by *Tsuga canadensis* and *Betula alleghaniensis*, although either of these species may be locally dominant at a small scale. Other minor canopy and subcanopy species may include *Aesculus flava*, *Picea rubens*, *Prunus pensylvanica*, *Betula lenta*, *Tilia americana* var. *heterophylla*, and at lower elevations, *Magnolia fraseri*, *Acer rubrum*, *Liriodendron tulipifera*, and *Halesia tetraptera* var. *monticola*. The tall-shrub stratum is over 2 meters in height, very dense (50 to 100 percent coverage) and dominated by *Rhododendron maximum*. The dense low-shrub stratum is dominated by *Leucothoe fontanesiana*. Other minor shrubs can include *Acer pensylvanicum*, *Ilex montana*, *Kalmia latifolia*, *Rubus allegheniensis*, *Sambucus racemosa* var. *pubens*, *Tsuga canadensis*, and *Vaccinium erythrocarpum*. The ground layer is dominated by leaf litter, fallen trees, and rocks. Herbaceous cover is sparse (0 to 5 percent) and is composed of scattered plants typical of middle to high elevation acid forests. Some of the more characteristic species include *Dryopteris intermedia*, *Medeola virginiana*, *Mitchella repens*, *Tiarella cordifolia*, *Oxalis montana*, and *Polypodium appalachianum*. Additional herb species found in this community include *Arisaema dracontium*, *Arisaema triphyllum*, *Aristolochia macrophylla*, *Aster acuminatus*, *Aster divaricatus*, *Circaea alpina*, *Goodyera pubescens*, *Goodyera repens*, *Huperzia lucidula*, *Laportea canadensis*, *Monotropa uniflora*, *Polygonatum pubescens*, *Prenanthes altissima*, and *Viola blanda*.

DATABASE CODE CEGL007861

## COMMENTS

## **Globally**

This association was described from the Great Smoky Mountains National Park. It should be compared with and distinguished from other associations in this alliance (*Tsuga canadensis - Betula alleghaniensis* Lower New England, Northern Piedmont Forest (CEGL006109) and *Tsuga canadensis - Betula alleghaniensis - Prunus serotina / Rhododendron maximum* Forest (CEGL006206)), as well as other vegetation in the southern Blue Ridge.

### Great Smoky Mountains National Park

On aerial photography, this community may appear similar to other Hemlock-Hardwood communities (*i.e. Tsuga canadensis - Liriodendron tulipifera / Rhododendron maximum / Tiarella cordifolia* Forest (CEGL007543) and *Tsuga canadensis - Halesia tetraptera - (Fagus grandifolia, Magnolia fraseri) / Rhododendron maximum / Dryopteris intermedia* Forest (CEGL007693)) but should be distinguishable by its higher elevation and topographic position. Grades into forest dominated by *Picea rubens* or *Tsuga canadensis* at higher elevations.

This association is known from the mountains of eastern Tennessee and western North Carolina.

## Great Smoky Mountains National Park

This community was sampled from the Cades Cove, Mount Le Conte, and Mount Guyot quadrangles. Historic samples come from the Thunderhead Mountain quadrangle (3420 to 4600 feet elevation). Samples of this community from the Cades Cove quadrangle ranged in elevation from 2720 to 3900 feet. Recent and historic samples from the Cades Cove quadrangle come from low slopes above the Left Prong of Anthony Creek; from protected slopes and coves north of McCampbell Knob; and in the vicinity of Forge Creek. Samples from the Mount Le Conte quadrangle ranged from 2602 to 4120 feet elevation and included samples from the western portion of the quadrangle near the Cherokee Orchard–Rainbow Falls trailhead and from coves east of Piney Mountain above Rocky Spur Branch. In the eastern portion of the Mount Le Conte quadrangle this community was sampled from low slopes above Horseshoe Branch and from Upper Porter's Creek on the far southwestern part of Mount Guyot quadrangle.

## ENVIRONMENTAL DESCRIPTION

## Globally

This community occurs on protected slopes and coves at elevations between 2800 to 4600 feet.

## Great Smoky Mountains National Park

This community is found on moderately steep, protected slopes and coves with western to northeastern aspects. Samples had a mean elevation of 3475 feet, ranging from 2600 to 4600 feet.

### VEGETATION DESCRIPTION

## Globally

Forests of lower slopes and coves dominated by *Tsuga canadensis* and *Halesia tetraptera* var. *monticola. Magnolia fraseri* or *Fagus grandifolia* can also be important in the canopy. Some occurrences have dense, tall-shrub strata dominated by *Rhododendron maximum*, while other occurrences have a more open shrub stratum with greater herbaceous cover, often dominated by *Dryopteris intermedia*. Other subcanopy/shrub species may include *Acer pensylvanicum*, *Acer saccharum*, *Acer rubrum*, *Amelanchier laevis*, *Betula alleghaniensis*, *Betula lenta*, and *Prunus pensylvanica*. Other common herbaceous species include *Mitchella repens*, *Medeola virginiana*, *Polystichum acrostichoides*, *Solidago caesia* var. *curtisii*, *Viola blanda*, and *Viola hastata*. *Rubus canadensis* is also common.

## Great Smoky Mountains National Park

This forest has a canopy dominated by *Tsuga canadensis* and *Halesia tetraptera* var. *monticola*. Other species that can have high coverage in the canopy or subcanopy include *Acer saccharum*, *Fagus grandifolia*, *Magnolia fraseri*, *Betula alleghaniensis*, and *Acer rubrum*. *Prunus serotina* can also be present in the subcanopy. Some occurrences have dense, tall-shrub strata dominated by *Rhododendron maximum*, but more typically the shrub stratum is open, with coverage by saplings of the canopy species. *Acer pensylvanicum* is also a typical shrub. The herb stratum has sparse to moderate coverage. Common species include *Aster divaricatus*, *Dryopteris intermedia*, *Huperzia lucidula*, *Medeola virginiana*, *Mitchella repens*, *Oxalis montana*, *Solidago caesia* var. *curtisii*, *Tiarella cordifolia*, and *Viola* spp. (e.g. *Viola blanda*, *Viola canadensis*, *Viola hastata*, *Viola rotundifolia*).

## OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK G2

## RANK JUSTIFICATION

This community is uncommon and geographically restricted to the Great Smoky Mountains and to Joyce Kilmer Wilderness in western North Carolina.

DATABASE CODE CEGL007693

COMMENTS *Globally* None

## Great Smoky Mountains National Park

This community is distinguished from Tsuga canadensis - Liriodendron tulipifera / Rhododendron maximum / Tiarella cordifolia Forest (CEGL007543) by not having Liriodendron tulipifera as an important component and by generally occurring at higher elevations (over 3000 feet). This community is distinguished from Tsuga canadensis – Betula alleghaniensis / Rhododendron maximum / Leucothoe fontanesiana Forest (CEGL007861) by occurring on more protected sites and having more diverse tree and herb strata. On aerial photography, this community may appear similar to other Hemlock-Hardwood communities (i.e. Tsuga canadensis - Liriodendron tulipifera / Rhododendron maximum / Tiarella cordifolia Forest (CEGL007543) and Tsuga canadensis – Betula alleghaniensis / Rhododendron maximum / Leucothoe fontanesiana Forest (CEGL007861)). In some occurrences Tsuga canadensis dominates beneath the deciduous upper canopy and may not be evident on air photos. Some occurrences, where Tsuga canadensis overtops the deciduous trees, may have signatures similar to Hemlock and Hemlock-White Pine Forests (i.e. Tsuga canadensis / Rhododendron maximum - Leucothoe fontanesiana Forest (CEGL007136) and Pinus strobus - Tsuga canadensis / Rhododendron maximum - Leucothoe fontanesiana Forest (CEGL007102)).

## NATIONAL VEGETATION CLASSIFICATION - SOUTHEASTERN UNITED STATES Cades Cove and Mount Le Conte quadrangles, Great Smoky Mountains National Park

April 1999
- Vegetation Descriptions

## OTHER NOTEWORTHY SPECIES

This community was historically habitat for montane populations of Red-cockaded Woodpecker (Picoides borealis).

## CONSERVATION RANK

G2

## RANK JUSTIFICATION

This community is naturally rare in the Appalachians, where shortleaf pine communities are uncommon. It is a fire-maintained community, and most remaining acreage is fire-suppressed with little compositional similarity to historic vegetation.

DATABASE CODE

CEGL003560

## **COMMENTS**

## Globally

More information is needed to characterisze and distinguish this community. Fire-suppressed examples of this community can be found in Virginia on Pine Mountain, with *Baptisia tinctoria* and *Aureolaria pectinata*. In the Great Smoky Mountains National Park, this community is being restored through the reintroduction of fire (B. Dellinger pers. comm.). There are no true remnants of this community left in Kentucky; all have *Quercus* spp. understory and shrubs and belong in a *Pinus echinata - Quercus* spp. Woodland Alliance (J. Campbell pers. comm.). The current presence of related vegetation in the Cumberlands and/or the Interior Low Plateau of Kentucky and Tennessee is more speculative; in those regions, this type was probably more common historically.

## Great Smoky Mountains National Park

This community was sampled on both the Cades Cove and Mount Le Conte quadrangles and occurs in other areas of the Park. On the Cade Cove quadrangle it was found at elevations from 2300 to 3800 feet. Areas sampled include Cobb Butt and Cobb Ridge, on south slopes and along the southern ridgeline from 3500 to 3800 feet elevation; an area north of the Cades Cove Loop Road, north of Tater Ridge, on a southwest sideridge of Cave Ridge at 2840 feet; and just southeast of the Cades Cove Loop Road, on northwest, steep, middle slopes above Anthony Creek at 2400 feet. Historic samples that may represent this community on the Cades Cove quadrangle were taken from the broad ridges and upper, west- to southeast-facing slopes north of Parsons Branch Road, above Rabbit Creek (2460 to2500 feet elevation); the upper east slopes of Leadbetter Ridge (2300 feet elevation); the eastern, middle slopes of Gregory Ridge (3040 to 3440 feet elevation); and the middle and upper south slopes of Mollies Ridge / Butt from 2840 to 3500 feet elevation. This community seems to be less common on the Mount Le Conte quadrangle and was found at elevations from 1850 to 4200 feet. It was sampled in the southwestern portion of the quadrangle, on the southeast slopes of Bullhead (4200 feet); in the central portion of the quadrangle on the lower western slopes of Mt. Winnesoka above Roaring Fork (2700 feet); north of Brushy Mountain, on the southeast slopes below Turkey Ridge (3700 feet); on the southern part of Potato Ridge; and on a northeast-running sideridge of Mt. Winnesoka, above Injun Creek (2180 feet). In the northeastern portion of the quadrangle, this community was found north of Copeland Creek, on the southwest high slopes over Copeland Creek (1850 feet).

## ENVIRONMENTAL DESCRIPTION

## **Globally**

This woodland occurs across a wide elevation range (1600-4000 feet) in the southern Appalachians, on exposed ridges and upper slopes with southerly and westerly exposures, over thin, excessively drained, nutrient-poor soils, and can be associated with rock outcroppings. Fire contributes to the maintenance of this community by destroying the litter layer, opening the canopy, releasing seed from the serotinous cones, and killing competing vegetation. Remaining examples of these forests are frequently fire-suppressed or affected by Southern pine beetle (*Dendroctonus frontalis*) and will have standing dead trees, thick litter layers, and much understory encroachment by hardwood species. Red Squirrels are known to cut branches to remove the *Pinus pungens* cones. It is thought this "squirrel grazing" may decrease the growth and vigor of trees (Zobel 1969). Canopy removal by ice storms stimulate oak sprouting and release advanced regeneration (Williams and Johnson 1992).

## Great Smoky Mountains National Park

This community is found on the Cades Cove quadrangle at elevations from 2300 to 3800 feet, on exposed ridgetops and on middle to upper slopes with west to southeast aspects. On the Mount Le Conte quadrangle it is found on similar sites, with south and southwest aspects, but reaches elevations over 4000 feet and as low as 1850 feet. Landforms are steep, flat to convex slopes and ridges. Soils are thin, rocky or sandy, and litter layers are thick. Almost all stands sampled showed evidence of Southern pine beetle (*Dendroctonus frontalis*) with dead or dying *Pinus pungens*.

Pinus pungens, Pinus rigida, Kalmia latifolia, Gaylussacia ursina, Gaultheria procumbens, Galax urceolata, Epigaea repens, Melampyrum lineare, Pteridium aquilinum

## VEGETATION DESCRIPTION

#### Globally

Mostly evergreen woodlands dominated by *Pinus pungens* and/or *Pinus rigida*, occurring over a dense ericaceous shrub stratum, on sharp ridges, mostly above 2000 feet elevation in the southern Blue Ridge. Canopy coverage can often approach that of a forest, especially in areas where fire has been excluded and deciduous species have significant coverage. Deciduous species that can be important, particularly in the subcanopy, include *Quercus prinus*, *Quercus coccinea*, *Quercus stellata*, *Nyssa sylvatica*, *Acer rubrum*, and *Oxydendrum arboreum*. *Pinus virginiana* and *Pinus strobus* can have high coverage and even codominate on some sites. The shrub stratum is dominated by ericaceous species, typically *Kalmia latifolia* in the tall-shrub stratum and *Vaccinium pallidum* as a low shrub. Other shrub species vary with location but include *Vaccinium stamineum*, *Vaccinium simulatum*, *Vaccinium pallidum*, *Vaccinium hirsutum*, *Vaccinium corymbosum*, *Rhododendron minus*, *Leucothoe recurva*, *Gaylussacia ursina*, *Gaylussacia baccata*, and *Fothergilla major*. Species commonly found in the sparse herb stratum include *Chimaphila maculata*, *Galax urceolata*, *Pteridium aquilinum* var. *latusculum*, *Xerophyllum asphodeloides*, *Comptonia peregrina*, *Leiophyllum buxifolium*, *Gaultheria procumbens*, *Iris verna*, *Dichanthelium* spp., and *Epigaea repens*, although herbaceous species composition will vary within the range of this community. *Smilax glauca* is a common vine.

### Great Smoky Mountains National Park

This community has a woodland to forest canopy dominated by *Pinus pungens* and/or *Pinus rigida*, which often overtop all other trees species. The canopy can include many standing dead and dying *Pinus* species. Some occurrences may have significant canopy coverage by *Quercus prinus* or *Quercus coccinea*. A tree subcanopy may be absent or well-developed, with as much as 80 percent coverage and composed of small-diameter trees, typically Acer rubrum, Oxydendrum arboreum, and Nyssa sylvatica. Other tree species that can occur in the canopy and subcanopy include Amelanchier laevis, Castanea dentata, Magnolia fraseri, Pinus virginiana, Quercus rubra, Robinia pseudoacacia, Carya alba, Pinus strobus, and Tsuga canadensis. A tall-shrub stratum varies from sparse and patchy to dense and continuous, often dominated by Kalmia latifolia and/or Vaccinium stamineum. Occurrences at high elevations (over 4000 feet) have Pieris floribunda as a dominant shrub. The short shrub stratum ranges in coverage from 0 to 80 percent and is often dominated by Gaylussacia ursina. Other shrubs that may dominate this stratum include Vaccinium hirsutum, Vaccinium pallidum, and Gaylussacia baccata. Additional shrub species that are found in this community include species from the canopy and subcanopy, as well as Acer pensylvanicum, Ilex montana, Pyrularia pubera, Quercus velutina, Rhododendron carolinianum, Rhododendron calendulaceum, Rhododendron maximum, and Sassafras albidum. The herbaceous stratum can be sparse to moderate in coverage and is composed of various sub-shrubs and dry site forbs. Epigaea repens, Galax urceolata, and Gaultheria procumbens typically have the most coverage. Other species in the herbaceous stratum can include Chimaphila maculata, Cleistes divaricata, Coreopsis major, Cypripedium acaule, Dichanthelium commutatum, Goodyera pubescens, Melampyrum lineare, Pteridium aquilinum, Schizachyrium scoparium, and Tephrosia virginiana. The litter layer is thick and often makes up greater than 50 percent of the ground cover. Smilax rotundifolia is a common vine.

## OTHER NOTEWORTHY SPECIES

Species in this community, which have the bulk of their worldwide range in the southern Blue Ridge, include *Leiophyllum buxifolium*, *Pieris floribunda*, *Pinus pungens*, and *Xerophyllum asphodeloides*. Animals found in this community include Red Squirrel (*Tamiasciurus hudsonicus*) and Wild Turkey (*Meleagris gallopavo*). The Mountain Pine Coneworm (*Dioryctria yatesi*), a moth larva that feeds only on the cones of *Pinus pungens*, may be locally abundant in this community (Hedlin *et al.* 1981).

#### CONSERVATION RANK

G3

### RANK JUSTIFICATION

This community is endemic to the southern Appalachian Mountains where it is maintained by periodic fire or extreme site conditions. Recent studies show that acreage of this community has decreased due to fire suppression (Turrill and Buckner 1995) and that many remaining examples have substantial hardwood invasion.

DATABASE CODE

CEGL007097

### **COMMENTS**

### Globally

Without periodic fire, this community will gradually succeed into forests dominated by *Quercus prinus* and *Quercus coccinea* (CEGL006271), except on the most extreme sites, where this vegetation is self-perpetuating. It is thought that woodlands dominated by *Pinus pungens* are associated with more xeric conditions than woodlands dominated by *Pinus pungens* in combination with other tree species (Barden 1977, Zobel 1969). Other communities with *Pinus pungens* occur in central Pennsylvania and in Virginia. These northern types are thought to have a different species composition and geology than the forests described here. Species associated with *Pinus pungens* in the northern part of its range that do not occur in this community include *Quercus ilicifolia, Viburnum acerifolium*, and *Vaccinium angustifolium*.

## Great Smoky Mountains National Park

Examples at the lowest elevations (below 2300 feet) on the Mount Le Conte quadrangle lacked *Pinus pungens* and *Pinus virginiana* and were dominated by *Pinus rigida* and *Quercus coccinea*. Many former examples of this community now exist as chestnut oak forests (CEGL006271) due to fire suppression and pine mortality due to Pine Bark Beetle. This community often grades into *Quercus prinus*-dominated forests (CEGL006271) on the ridgelines above. Other adjacent communities can include heath shrublands or oak - hickory forests on less exposed sites.

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM Upland

## **RANGE**

## Globally

Paulownia tomentosa is native to eastern Asia, where it is a minor component of deciduous mesophytic forests. It has become naturalized in portions of the eastern United States, where it occurs as small, scattered populations along roadsides, in disturbed woodlots, and in streamside forests. The species has been widely planted in eastern North America from Montreal to Florida, and west to Missouri and Texas. The association, however, is currently only defined for montane portions of North Carolina, Tennessee, and Virginia.

## Great Smoky Mountains National Park

This community was not sampled on the Cades Cove or Mount Le Conte quadrangles. It is possible in the park.

## ENVIRONMENTAL DESCRIPTION

## **Globally**

This woodland occurs on steep roadcuts, highway rights-of-way, and in other disturbed steep and rocky areas. *Paulownia tomentosa* is not likely to become an invasive pest, since it requires large-scale, substrate-scarifying disturbance for optimal establishment and maintenance.

**RANGE** 

**Globally** 

This community occurs in the mountains of Georgia, North Carolina, and Tennessee.

## Great Smoky Mountains National Park

This community was sampled on the Mount Le Conte quadrangle and not on the Cades Cove quadrangle, although it is possible there. This community is uncommon in the landscape but possible in other areas of the Park. On the Mount Le Conte quadrangle it was sampled on Brushy Mountain, ridges along the Alum Cave Trail south of Mount Le Conte (4600 and 4900 feet), and in the southwestern portion of the quadrangle on the western ridge of Balsam Point, the vicinity of Chimney Tops, and east of Bullhead.

#### ENVIRONMENTAL DESCRIPTION

## Globally

This community occurs on ridges and steep rocky slopes at intermediate elevations in the southern Blue Ridge (4000 to 5000 feet elevation). Windfall, landslides, and small, localized, lightning-caused fires are important in the establishment and maintenance of these shrublands. This community can result from secondary succession after fire or logging or can occur as a topo-edaphic climax on steep or exposed sites.

#### Great Smoky Mountains National Park

This community occurs on southerly exposed ridges and steep slopes below 5000 feet elevation. Samples range from 4190 to 4900 feet elevation. One example is in a gap, on a convex slope, and may be a fire scar.

G2G3

#### VEGETATION DESCRIPTION

Globally

No information

## Great Smoky Mountains National Park

This community is a mostly evergreen shrubland, although deciduous shrubs may be present and even locally dominant. Shrubs form a dense, sometimes impenetrable thicket, one to four meters tall. The most typical shrub dominants are *Kalmia latifolia* and *Rhododendron catawbiense*, although *Gaylussacia baccata*, *Leiophyllum buxifolium*, *Pieris floribunda*, *Rhododendron carolinianum*, *Rhododendron maximum*, *Vaccinium corymbosum* are dominant or have high coverage in some occurrences. Other shrubs include *Aronia melanocarpa*, *Clethra acuminata*, *Vaccinium simulatum*, *Vaccinium stamineum*, and *Viburnum nudum* var. *cassinoides*. Small openings in the shrub canopy are dominated by rock or herbs, with some occurrences having up to 60 percent exposed rock. However, herb cover beneath the shrub canopy is absent or very sparse (< 5 percent) and may include *Galax urceolata*, *Gaultheria procumbens*, *Goodyera pubescens*, *Melampyrum lineare*, *Mitchella repens*, and *Pteridium aquilinum*. *Smilax rotundifolia* is a common vine. Small, scattered trees are possible (*Acer rubrum*, *Amelanchier laevis*, *Betula alleghaniensis*, *Ilex montana*, *Magnolia fraseri*, *Nyssa sylvatica*, *Oxydendrum arboreum*) and may be more typical of shrublands resulting from intense fires on less exposed sites.

#### OTHER NOTEWORTHY SPECIES

Animals observed in this community include Black Bear, Peregrine Falcon, Dark-eyed Junco, and Black-throated Green Warbler.

#### CONSERVATION RANK

#### RANK JUSTIFICATION

This is a locally common heath bald type in parts of the southern Blue Ridge. Some occurrences represent a topo-edaphic climax, while other areas require fire to maintain the physiognomy. Fire-maintained occurrences are threatened by general fire prevention in the mountains.

DATABASE CODE CEGL003814

#### **COMMENTS**

## Globally

These shrublands possibly have a broader distribution and typically occur at lower elevations than other montane shrublands in the *Rhododendron (catawbiense, carolinianum) - Kalmia latifolia* Shrubland Alliance. In the southern Blue Ridge, this shrubland generally occurs at elevations over 1200 meters (4000 feet) and grades into forests dominated by *Quercus coccinea, Pinus rigida, Pinus pungens,* and/or *Quercus rubra*. High elevation occurrences may be compositionally similar to another heath bald community, *Rhododendron carolinianum - Rhododendron catawbiense - Leiophyllum buxifolium* Shrubland (CEGL007876).

## Great Smoky Mountains National Park

This community typically occurs below the elevation of spruce - fir forests and adjacent to forests dominated by Table Mountain pine, northern red oak, or *Fagus grandifolia* ("Beech Gaps"). Occurrences at high elevations may be transitional to *Rhododendron carolinianum - Rhododendron catawbiense - Leiophyllum buxifolium* Shrubland (CEGL007876), and it may be difficult to distinguish the two heath bald signatures. The alliance may serve as a better mapping unit for these communities.

CLASSIFICATION CONFIDENCE LEVEL USFWS WETLAND SYSTEM Upland

**RANGE** 

Globally

This community occurs in the Great Smoky Mountains of eastern Tennessee.

#### Great Smoky Mountains National Park

This community was sampled from the highest elevations of the Mount Le Conte quadrangle and is not expected on the Cades Cove quadrangle. It may occur in other high elevation areas of the Park. On the Mount Le Conte quadrangle this community was sampled from Rocky Spur north of Mount Le Conte; from Clifftop west of the Mount Le Conte summit; and from the Jumpoff, in the vicinity of Mount Kephart.

## ENVIRONMENTAL DESCRIPTION Globally

#### Great Smoky Mountains National Park

This community occurs on steep ridges, rock outcroppings, and landslides at elevations over 5500 feet, in the spruce - fir zone. High solar irradiation and desiccating winds, in combination with the shallow, nutrient-poor soils, are key environmental factors influencing this community. Locally, vegetation is influenced by seepage areas on steep cliffs and ledges (*e.g.* southwest portion of the Mount Le Conte summit). This community is known from areas of exposed slate on the steep ridges of Mount Le Conte (Ramseur 1958).

Rhododendron carolinianum, Rhododendron catawbiense, Leiophyllum buxifolium, Abies fraseri, Picea rubens, Diervilla sessilifolia, Menziesia pilosa

#### VEGETATION DESCRIPTION

**Globally**No information

## Great Smoky Mountains National Park

This community has 25 to 100 percent shrub cover and may occur as a dense shrubland, two to four meters tall, or as a shorter,

G1

more open shrubland with areas of exposed rock, scattered mats of prostrate vegetation, and isolated clumps of herbaceous species. The most common shrubs are *Rhododendron carolinianum*, *Rhododendron catawbiense*, and *Leiophyllum buxifolium*, locally dominant in patches and forming a mosaic. Shrubs are less than one meter tall on the steepest, rockiest, most exposed sites, and taller on gentle, more protected sites with greater soil development. Other associated shrubs with minor coverage may include *Abies fraseri*, *Aronia arbutifolia*, *Aronia melanocarpa*, *Diervilla sessilifolia*, *Ilex montana*, *Menziesia pilosa*, *Pieris floribunda*, *Prunus pensylvanica*, *Vaccinium corymbosum*, *Vaccinium erythrocarpum*, and *Viburnum nudum* var. *cassinoides*. Under tall dense shrubs there is little herb cover, but in more open shrublands, on steep cliffs with seepage, herbaceous species may grow in dense patches on ledges and crevices. Herbaceous species such as *Calamagrostis cainii*, *Carex misera*, *Geum radiatum*, *Saxifraga michauxii*, *Solidago glomerata*, *Scirpus cespitosus* are associated with this community on the summits of Mount Le Conte. Thick hummocks of lichens and mosses can occur on flatter sites. Scattered wind-sheared trees of *Picea rubens* or *Abies fraseri* are possible in some examples.

### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK

#### RANK JUSTIFICATION

This community is limited in extent, occurring as scattered pockets in the southern Appalachian Mountains, possibly limited to the Great Smoky Mountains. This fragile community is threatened by heavy recreational use.

DATABASE CODE CEGL007876

#### **COMMENTS**

#### Globally

The taxonomic distinctions between *Rhododendron minus* and *Rhododendron carolinianum* is currently uncertain. Some of what is treated here as *Rhododendron carolinianum* may prove to be *Rhododendron minus*. This association contains a portion of the former concept of *Rhododendron carolinianum* Shrubland (CEGL003816), which occurs at lower elevations in areas of quartzite and meta-arkose geology.

#### Great Smoky Mountains National Park

This shrubland grades into vegetation dominated by *Picea rubens* and/or *Abies fraseri*. Particularly on the summit and high slopes of Mount Le Conte, the taxonomic distinction between *Rhododendron minus* and *Rhododendron carolinianum* is uncertain. Some of what is treated here as *Rhododendron carolinianum* may prove to be *Rhododendron minus*. It may be difficult to distinguish the signature of this heath bald type from that of *Kalmia latifolia - Rhododendron catawbiense – (Gaylussacia baccata, Pieris floribunda, Vaccinium corymbosum)* Shrubland (CEGL003814), especially at transitional elevations. The alliance may serve as a better mapping unit for these communities.

## CHARACTERISTIC SPECIES

## ${\it Globally}$

Vitis aestivalis

## Great Smoky Mountains National Park

Vitis aestivalis, Aristolochia macrophylla

#### VEGETATION DESCRIPTION

#### Globally

This vegetation includes thickets dominated by dense *Vitis aestivalis*. Emergent small to large trees (usually draped in *Vitis*) can occur. Herbaceous cover is low because of the dense vine cover.

## Great Smoky Mountains National Park

This community is strongly dominated by the vine Vitis aestivalis. Vines, extremely thick in patches and covering nearly every

tree as well as the ground, have 50 to 100 percent coverage. Trees in the canopy and subcanopy have zero to 50 percent coverage and vary from site to site, but typical species include *Acer rubrum, Acer saccharum, Halesia tetraptera* var. *monticola*, and *Liriodendron tulipifera*. The shrub layer is sparse. The herb layer is sparse to moderate, decreasing with vine coverage. Herbaceous composition varies from site to site but is typical of mesic forests in the Park. Some of the more common species from the sampled areas are *Ageratina altissima* var. *altissima*, *Amphicarpaea bracteata*, *Arisaema triphyllum* ssp. *triphyllum*, *Polystichum acrostichoides*, *Sanguinaria canadensis*, and *Viola* spp. Beneath the vine canopy, coarse woody debris and tip-up mounds are typical.

### OTHER NOTEWORTHY SPECIES

Black Bear use this community.

CONSERVATION RANK G2G3

#### RANK JUSTIFICATION

This is an uncommon community. It is restricted within its range and could be limited by specific disturbance regimes.

DATABASE CODE CEGL003890

#### **COMMENTS**

#### Globally

This community can be important for wildlife, especially bears.

#### Great Smoky Mountains National Park

Forests previously occupying sites that support this community are mesic forest types, such as cove forests or mesic forest dominated by chestnut oak and red oak. Forests on steep mesic sites may be more susceptible treefall and gap formation.

CLASSIFICATION CONFIDENCE LEVEL 2

USFWS WETLAND SYSTEM Upland

**RANGE** 

Globally

This forest occurs at high elevations in the southern Appalachian Mountains of North Carolina and Tennessee.

#### Great Smoky Mountains National Park

This community was sampled on the summit of Mount Le Conte on the Mount Le Conte quadrangle. It was not sampled, nor is it expected, on the Cades Cove quadrangle, although it may occur in other areas of the Park.

#### ENVIRONMENTAL DESCRIPTION

#### Globally

This vegetation results from severe disturbance of spruce - fir forests (*i.e.* Balsam Woolly Adelgid-affected stands), as well as exposed sites with other frequent natural disturbance. It occurs on exposed summits and high slopes, typically at elevations over 6000 feet.

## CHARACTERISTIC SPECIES

**Globally** 

#### Great Smoky Mountains National Park

Rubus canadensis, Diervilla sessilifolia, Athyrium filix-femina ssp. asplenioides, Solidago glomerata

### VEGETATION DESCRIPTION

## Globally

High elevation Appalachian *Rubus* thickets resulting from death of *Abies fraseri* or shrub invasion of grazed fire meadows. Differs from *Rubus* thickets on grassy balds by predominance of forbs rather than sedges and by frequent presence of *Rubus idaeus*. Long-term future of this community is uncertain, but it appears to be fairly stable over periods of several decades. Standing dead *Abies fraseri* are frequent. Scattered living *Picea rubens, Sorbus americana, Betula allegheniensis*, and *Amelanchier laevis* may occur.

#### Great Smoky Mountains National Park

This is successional vegetation on the summit of Mount Le Conte resulting from the death of *Abies fraseri*. Vegetation is variously dominated by *Rubus canadensis* and *Diervilla sessilifolia* (on the most exposed sites), by dense *Rubus canadensis*, or by dense *Athyrium filix-femina* ssp. *asplenioides* and *Solidago glomerata* (on more protected sites). Standing dead trees tower above the shrubs and herbs, and there is much downed woody debris. Other species present include *Abies fraseri*, *Agrostis perennans*, *Angelica triquinata*, *Aster acuminatus*, *Carex brunnescens*, *Carex crinita*, *Carex intumescens*, *Carex debilis*, *Cinna latifolia*, *Clintonia borealis*, *Danthonia compressa*, *Oxalis montana*, *Picea rubens*, *Prunus pensylvanica*, *Rugelia nudicaulis*, and *Sorbus americana*.

## OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK

GM

#### RANK JUSTIFICATION

This community represents an altered vegetation type, modified by the effects of an alien pest species. Examples of this vegetation once represented what is now a globally rare and critically imperiled community that has an uncertain future. This modified vegetation is now a natural part of high elevation landscapes in the southern Blue Ridge and an important part of the functioning landscape, providing habitat for many southern Appalachian species. For conservation planning purposes, examples of this community may be best considered low quality occurrences of forests in the *Abies fraseri - (Picea rubens)* Forest Alliance.

#### Great Smoky Mountains National Park

No information

#### VEGETATION DESCRIPTION

#### **Globally**

Vegetation composition, density, and height vary with frequency of flooding, substrate, and soil depth. Alnus serrulata and Xanthorhiza simplicissima are common and characteristic. Other shrubs may include Arundinaria gigantea, Diervilla sessilifolia, Salix (nigra, sericea), Rhododendron (arborescens, viscosum, maximum, periclymenoides), Kalmia latifolia, Leucothoe fontanesiana, Itea virginica, and Viburnum nudum var. cassinoides. Arborescent species that occur as tall shrubs (or as occasional trees, less than 10 percent cover) include Acer rubrum, Carpinus caroliniana, Diospyros virginiana, Liquidambar styraciflua, Liriodendron tulipifera, Platanus occidentalis, and Tsuga canadensis. Open areas dominated by grasses and forbs include species such as Agrostis perennans, Boykinia aconitifolia, Carex torta, Holcus lanatus (exotic), Lycopus virginicus, Trautvetteria caroliniensis, Houstonia serpyllifolia, Impatiens capensis, Hypericum mutilum, Viola primulifolia, and Eupatorium fistulosum. Adjacent alluvial forests are dominated by Tsuga canadensis, Liriodendron tulipifera, Betula lenta, and, at lower elevations below 600 meters (2000 feet), Platanus occidentalis and Liquidambar styraciflua.

This community occurs in the southern Blue Ridge of North Carolina, Tennessee, and Virginia.

#### Great Smoky Mountains National Park

This community was sampled from the Cade Cove quadrangle. It was not sampled on the Mount Le Conte quadrangle, nor is it expected to occur there. This community is possible in other areas of the Park. On the Cade Cove quadrangle this community was sampled from Russell Field Bald and from Gregory Bald.

#### ENVIRONMENTAL DESCRIPTION

#### **Globally**

This community occurs on moderate to high elevation peaks and saddles in the southern Blue Ridge. It is found on high elevation (usually above 1350 meters or 4500 feet), often south- to southwest-facing domes, ridgetops, and gentle slopes. Strong winds, high rainfall, frequent fog, shallow rocky soils, and extremes of temperature and moisture are characteristic of these environments.

## Great Smoky Mountains National Park

The two examples of this community sampled were on gentle ridges, at 4320 and 4950 feet elevation. Invasion by woody species is occurring in both examples.

### Great Smoky Mountains National Park

Danthonia compressa

#### VEGETATION DESCRIPTION

#### Globally

This community consists of graminoid-dominated vegetation with scattered shrubs, occurring on moderate to high elevation peaks and saddles in the southern Blue Ridge. Characteristically, this vegetation is strongly dominated by *Danthonia compressa* or in some areas codominated by the sub-shrub *Sibbaldiopsis tridentata* (= *Potentilla tridentata*). Other characteristic herbaceous species are *Angelica triquinata*, *Aster acuminatus* (= *Oclemena acuminata*), *Carex pensylvanica*, *Carex debilis*, *Carex intumescens*, *Carex brunnescens*, *Deschampsia flexuosa*, *Erythronium umbilicatum* ssp. *monostolum*, *Gentiana austromontana*, *Gentianella quinquefolia*, *Houstonia serpyllifolia*, *Ionactis linariifolius* (= *Aster linariifolius*), *Lysimachia* 

quadrifolia, Potentilla canadensis, Prenanthes roanensis, Smilax herbacea, Solidago bicolor, Solidago glomerata, Stachys clingmanii, Trautvetteria caroliniensis var. caroliniensis. The floristic composition is a mixture of widespread species, northern disjunct species (such as Agrostis mertensii, Carex aenea, Minuartia groenlandica, Senecio schweinitzianus, Sibbaldiopsis tridentata), and southern Appalachian endemics (such as Erythronium umbilicatum ssp. monostolum, Geum geniculatum, Geum radiatum, Houstonia serpyllifolia, Lilium grayi, Prenanthes roanensis, Solidago glomerata, Stachys clingmanii). Typical shrubs, which may occur as scattered individuals or as patches, are Rhododendron calendulaceum, Rhododendron catawbiense, Menziesia pilosa, Vaccinium corymbosum, and Rubus canadensis. Species indicative of past grazing include Phleum pratense, Agrostis gigantea, Hieracium scabrum, Rumex acetosella, Prunella vulgaris.

#### Great Smoky Mountains National Park

This community includes open vegetation dominated by graminoid species, sometimes with large patches dominated by deciduous ericads. Danthonia compressa is the aspect dominant herb, although other herbaceous species with high coverage include Arnoglossum muehlenbergii, Cinna latifolia, Danthonia spicata, Phleum pratense, Poa compressa, Potentilla canadensis, and Rumex acetosella. Other species present in the herbaceous stratum include Achillea millefolium, Ageratina altissima var. roanensis, Arrhenatherum elatius, Aster dumosus, Aster paternus, Carex aenea, Carex leavenworthii, Dichanthelium laxiflorum, Galium pilosum, Houstonia purpurea var. purpurea, Houstonia serpyllifolia, Hypericum punctatum, Juncus effusus, Juncus marginatus, Luzula acuminata, Lysimachia quadrifolia, Malaxis unifolia, Melampyrum lineare, Potentilla simplex, Prenanthes altissima, Prunella vulgaris, Rubus canadensis, Rudbeckia hirta, Rumex acetosella, Senecio anonymus, Solanum carolinense, and Viola primulifolia var. villosa. Alien species present that may indicate past grazing include Agrostis stolonifera, Carduus acanthoides, Cerastium nutans, Holcus lanatus, Leucanthemum vulgare, Phleum pratense, Trifolium pratense, and Veronica serpyllifolia. On Gregory Bald, the shrubs Rhododendron calendulaceum and Vaccinium corymbosum are locally dominant. Other scattered woody plants in this community include Amelanchier laevis, Kalmia latifolia, Magnolia acuminata, and Prunus serotina.

#### OTHER NOTEWORTHY SPECIES

Rare or northern disjunct plant species reported from this community include Agrostis mertensii, Alnus viridis ssp. crispa, Botrychium multifidum, Calamagrostis canadensis, Carex aenea, Carex cristatella, Carex misera, Delphinium exaltatum, Gentiana austromontana, Geum geniculatum, Houstonia purpurea var. montana, Huperzia selago, Hypericum buckleyi, Lilium grayi, Lilium philadelphicum, Lycopodium dendroideum, Lycopodium hickeyi, Minuartia groenlandica, Monarda media, Phlox subulata, Platanthera grandiflora, Poa palustris, Prenanthes roanensis, Rhododendron cumberlandense, Rhododendron vaseyi, Senecio schweinitzianus, Spiranthes ochroleuca, and Trisetum spicatum (Schafale and Weakley 1990). Rare animals include Microtus chrotorrhinus carolinensis and Thryomanes bewickii altus (DeSelm and Murdock 1993). Exotic species that occur, probably as a result of grazing, include Prunella vulgaris, Phleum pratense, and Poa compressa.

#### CONSERVATION RANK G1

#### RANK JUSTIFICATION

This community has a small range, few occurrences, and is rapidly disappearing due to vegetational succession. This community is threatened by high levels of recreational use and the introduction of exotic plant and animal species, as well as by successional trends of uncertain cause.

DATABASE CODE CEGL004242

#### **COMMENTS**

#### Globally

This montane grassland is typically surrounded by dwarfed forests dominated by *Fagus grandifolia* or *Quercus rubra*. Notable examples include various peaks of the Roan Mountain complex, Long Hope Valley, Shining Rock Wilderness, and the Great Smoky Mountains National Park. The origin of this community is not clear, and in fact, several mechanisms, both natural and anthropogenic, have been proposed, including fire, grazing, trampling, clearing, climatic change, windthrow, or some combination of these influences. The presence of northern disjunct species requiring open habitat may suggest that some of these areas have been open since the Ice Age. A. Weakley (pers. comm.) suggests that the balds of Roan Mountain, Tennessee, are primarily natural, whereas those farther north are of anthropogenic origin. It appears that new occurrences of this community are not being created and those that exist are being encroached by shrub and tree species. Lindsay (1976) reported that examples of this community in the Great Smoky Mountains National Park will have disappeared by the end of the century if management is not undertaken to halt invasion by woody plants. However, these balds are among those most likely to be of anthropogenic origin.

#### Great Smoky Mountains National Park

Gregory Bald is currently maintained by manual woody species removal.

This community occurs in a matrix with Picea rubens - Abies fraseri Forest.

#### Great Smoky Mountains National Park

See above

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK

#### RANK JUSTIFICATION

This rock outcrop community is known only from outcrops of Anakeesta slate in the Great Smoky Mountains of Tennessee. This community is naturally rare, representing a tiny fraction of the high mountain landscape. It is known from only a few occurrences. Atmospheric deposition of air pollutants may have an adverse effect on these high elevation communities. It is a fragile community and can be damaged by trampling in areas of high recreational use.

DATABASE CODE CEGL004278

#### **COMMENTS**

#### **Globally**

Similar vegetation may range into the Black and Craggy Mountains of North Carolina but associated with a different geology.

#### Great Smoky Mountains National Park

In some areas this community may occur as a mosaic with *Rhododendron carolinianum - Rhododendron catawbiense - Leiophyllum buxifolium* Shrubland (CEGL007876). The vegetation of landslide scars on Mount Le Conte is included in this association, along with vegetation of more stable cliffs, ledges and seeps. The vegetation on the stable rocky substrates serves as a source pool for the more ephemeral scars, which revegetate slowly in a rather chaotic, stepwise succession, thus the different habitats are not compositionally distinct (J. Boetsch pers. comm.).

Chrysosplenium americanum, Boykinia aconitifolia, Cicuta maculata, Houstonia serpyllifolia, Viola cucullata, Viola macloskeyi ssp. pallens, Lilium grayi, Oxypolis rigidior, Parnassia asarifolia, Tiarella cordifolia, Thalictrum clavatum, Trautvetteria caroliniensis, Stellaria corei, and Geum geniculatum. Occurrences associated with more acidic soil conditions often contain Juncus gymnocarpus (G. Kauffman pers. comm.). This association often occurs in cove forests.

#### Great Smoky Mountains National Park

This community includes forested seeps in cove forests dominated by *Aesculus flava, Tilia americana* var. *heterophylla*, and *Betula alleghaniensis*. The seeps are open herbaceous vegetation, but canopy trees hang over the seep and can have up to 70 percent coverage. Shrubs are absent to sparse. Herbs have 50 to 100 percent coverage. Species with the highest coverages are *Diphylleia cymosa, Saxifraga micranthidifolia, Cimicifuga americana, Laportea canadensis, Tiarella cordifolia*, and *Impatiens pallida*. Other common herbs include *Ageratina altissima* var. *roanensis, Aster divaricatus, Chrysosplenium americanum, Euonymus oboyatus*, and *Monarda didyma*. Bryophytes, other than *Sphagnum*, can have substantial cover on rocks.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK

### RANK JUSTIFICATION

This community occurs at moderate to high elevations of the southern Blue Ridge Mountains of western North Carolina, eastern Tennessee, southwestern Virginia, northern Georgia, and probably northwestern South Carolina. It occurs as a small patch community, embedded in a variety of regional forest types. While restricted in range and of small size, the community is relatively frequent within its range; many examples are protected, and threats are relatively few and minor.

DATABASE CODE CEGL004296

#### **COMMENTS**

#### Globally

These communities are often not large enough to be readily mappable but a distinctive habitat for many plants, invertebrate and vertebrate animals. The nominal species *Diphylleia cymosa* is a conspicuous component of this association but may also be found in seeps of varying canopy closure at middle and high elevations. The associated nominal species, *Saxifraga micranthidifolia* and *Laportea canadensis*, are indicative of shaded seeps (G. Kauffman pers. comm.). Another high elevation herbaceous seep association known from the southern Appalachians, *Impatiens (capensis, pallida) - Monarda didyma - Rudbeckia laciniata* var. *humilis* Herbaceous Vegetation, often occurs on boulder fields or in northern hardwood forests, at higher elevations than the association defined here.

## Great Smoky Mountains National Park

This community is too small to map and often occurs under a forested canopy.

### VEGETATION DESCRIPTION

## ${\it Globally}$

This community includes herbaceous vegetation on rock substrates associated with waterfalls. Vegetative coverage is sparse to moderate with 50 to 75 percent unvegetated surface (bedrock) possible. Vegetation grows in cracks and on organic accumulations on ledges. It is characterized by a variable but unique assemblage of vascular herbs, algae, and bryophytes, many of which are endemic to this community. Composition of this community varies from location to location, in part due to its insular nature (Zartman and Pittillo 1998). Characteristic species include liverworts (*Bazzania denudata, Conocephalum conicum, Oxalis montana, Pellia epiphylla, Pellia neesiana, Plagiochila austini, Plagiochila caduciloba, Plagiochila sharpii* ssp. sharpii, Plagiochila spp., Plagiochila sullivantii, Riccardia multifida), mosses (*Bryocrumia vivicolor, Dichodontium pellucidum,* 

G2

Fissidens osmundioides, Hyophila involuta, Mnium marginatum, Oncophorus raui, Plagiomnium affine, Plagiomnium carolinianum, Pseudotaxiphyllum distichaceum, Sphagnum girgensohnii, Sphagnum quinquefarium, Thalictrum spp., Thamnobryum alleghaniense), ferns (Adiantum pedatum, Asplenium monanthes, Asplenium montanum, Asplenium trichomanes ssp. trichomanes, Cystopteris protrusa, Grammitis nimbata (= Micropolypodium nimbatum), Hymenophyllum tayloriae, olypodium virginianum, Trichomanes boschianum, Trichomanes intricatum, Vittaria appalachiana), and other vascular species (Galax urceolata, Heuchera parviflora vat. parviflora, Houstonia serpyllifolia, Huperzia porophila, Hydrocotyle americana, Impatiens capensis, Phegopteris connectilis, Saxifraga carevana, Saxifraga caroliniana, Carex biltmoreana).

#### Great Smoky Mountains National Park

See above

OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK

#### RANK JUSTIFICATION

This community is very limited, known only from a few dozen occurrences, most of which are less than one acre in size, and the largest are only about two acres in size. Most examples are in rugged montane areas and have escaped direct disturbance, though many may have been affected by logging or development on surrounding lands. Water quality declines may have detrimental impacts on this very delicate and easily impacted community. Even limited human visitation has degraded some occurrences.

DATABASE CODE CEGL004302

#### **COMMENTS**

#### Globally

This community varies in composition with no consistent dominant species. Nominal species are either constant or regional endemics. South and west of the Blue Ridge escarpment, this association is less diverse than those occurrences in the central portion of the range. Zartman and Pittillo (1998) found *Thuidium delicatulum*, *Atrichum oerstedianum*, *Houstonia serpyllifolia*, and *Plagiomnium ciliare* to be the most constant species in spray cliff communities sampled from the Chattooga River Watershed in northern Georgia, western North Carolina, and northwestern South Carolina.

#### Great Smoky Mountains National Park

This community occurs adjacent to deciduous and hemlock cove forests

#### **RANGE**

#### Globally

This community occurs at high elevations in the southern Blue Ridge of North Carolina and Tennessee and may range into Virginia.

#### Great Smoky Mountains National Park

This community was sampled from a single location on the Mount Le Conte quadrangle but is likely in other high elevation areas of the Park. It was not found, nor is it likely, on the Cade Cove quadrangle. It was sampled in the southestern portion of the Mount Le Conte quadrangle, in the vicinity of Ice Water Springs, east of Mount Kephart.

#### ENVIRONMENTAL DESCRIPTION

#### Globally

This community occurs on seepage slopes and is scattered throughout the high elevations (> 5000 feet) of the southern Blue Ridge. These perennial seeps tend to be rocky and occur over gravelly muck or with some bedrock outcropping. Slopes are gentle to moderately steep. They are influenced by the high rainfall and low evaporation rates in these high mountain landscapes.

#### Great Smoky Mountains National Park

This community was sampled from a flat area around Ice Water Springs, at 5900 feet elevation. It is a relatively open, sunny seep with standing water and a mucky substrate.

#### VEGETATION DESCRIPTION

Globally

G2

This non-alluvial wetland is generally graminoid-dominated but may have significant coverage by trees or shrubs, especially around the edges. Particularly small examples may be completely shaded by trees in the community and in the adjacent forests. Typically this community has well-developed *Sphagnum* mats. Characteristic species include *Carex gynandra*, *Carex ruthii*, *Carex atlantica*, *Carex flexuosa*, *Glyceria striata*, *Glyceria melicaria*, *Hypericum graveolens*, *Hypericum mitchellianum*, *Hypericum mutilum*, *Chelone lyonii*, *Platanthera clavellata*, and *Drosera rotundifolia*. Occurrences of this community are surrounded by or were formerly surrounded by forests dominated by *Abies fraseri* and *Picea rubens* or by the highest northern hardwood forests (forests dominated by *Fagus grandifolia*, *Betula alleghanensis*, and *Aesculus flava*).

#### Great Smoky Mountains National Park

This community is a spring-associated seep dominated by patches of forbs, sedges, and peatmoss. The aspect dominants are *Ageratina altissima* var. *roanensis* and *Chelone obliqua*; however, *Carex ruthii, Viola* spp., *Sphagnum* spp., and *Carex gynandra* also have high coverage. Other species include *Aconitum uncinatum* ssp. *muticum, Agrostis perennans, Angelica triquinata, Aster acuminatus* var. *acuminatus*, *Cinna latifolia, Dennstaedtia punctilobula, Diervilla sessilifolia, Glyceria nubigena, Oxalis montana*, and *Solidago glomerata*.

#### OTHER NOTEWORTHY SPECIES

No information

CONSERVATION RANK

#### RANK JUSTIFICATION

This community occurs in a limited portion of high elevation areas of the southern Blue Ridge. Occurrences are small and embedded in forests or sometimes high elevation grassy balds or heath balds. Many examples are in protected areas. Those that are not are vulnerable to logging and alteration of hydrology.

DATABASE CODE CEGL007697

#### **COMMENTS**

#### Globally

This community is distinguished from other high elevation seeps in the Blue Ridge (*Impatiens (capensis, pallida*) - *Monarda didyma* - *Rudbeckia laciniata* var. *humilis* Herbaceous Vegetation (CEGL004293) and *Diphylleia cymosa* - *Saxifraga micranthidifolia* - *Laportea canadensis* Herbaceous Vegetation (CEGL004296)) by being graminoid-dominated and having *Sphagnum* present. Examples of this association generally lack *Rudbeckia laciniata, Laportea canadensis, Monarda didyma*, and *Diphylleia cymosa*. It is distinguished from southern Blue Ridge bog communities by floristic differences and by occurring on a pronounced slope at high elevations.

## **Great Smoky Mountains National Park**

This community is surrounded by forests dominated by Picea rubens, Betula alleghaniensis, and Abies fraseri.

#### VEGETATION DESCRIPTION

#### Globally

This is a herbaceous-dominated seepage slope, one to two acres in size. The vegetation is open with little or no shading by the surrounding forest. Graminoid species have almost continuous coverage, growing within large mats of *Sphagnum*. It is strongly dominated by *Calamagrostis cainii*. Other species with moderate coverage include *Carex ruthii*, *Carex misera*, *Gentiana linearis*, and *Dennstaedtia punctilobula*. Additional herbaceous species include *Carex debilis*, *Glyceria nubigena*, *Hypericum graveolens*, *Krigia montana*, *Parnassia asarifolia*, and *Solidago glomerata*. Shrubs and small trees may be scattered within the seep but are more prominent around the perimeter. Woody species include *Abies fraseri*, *Picea rubens*, *Prunus pensylvanica*,

Rhododendron catawbiense, Rubus canadensis, and Vaccinium erythrocarpum.

### Great Smoky Mountains National Park

See above

OTHER NOTEWORTHY SPECIES

CONSERVATION RANK G1

#### RANK JUSTIFICATION

This is a highly restricted, naturally rare community and known from only a single location. The dominant species *Calamagrostis cainii* is only known from the summits of Mount Le Conte and in the Blacks and Craggy Mountains. Its current taxonomy is uncertain; it may be better classified as a very local expression of Blue Ridge High Elevation Seep (Sedge Type) (CEGL007697), a G2 community.

DATABASE CODE CEGL007877

COMMENTS Globally

## Great Smoky Mountains National Park

Calamagrostis cainii may be locally dominant in seepage inclusions of other communities on Mount Le Conte, such as cliffs, heath shrublands, and steep landslide scars. The site that supports this community is a former landslide scar directly downslope from Cliff Tops, where there is a large concentration of Calamagrostis cainii, growing in stable ledge and seeps. These stable substrates provide propagule sources for revegetating landslide scars, thus there is a tight spatial autocorrelation for species composition between scars and nearby ledges and cliffs (J. Boetsch pers. comm.). This community may be better classified as a very local expression of Blue Ridge High Elevation Seep (Sedge Type) (CEGL007697).
